INDICES OF AGRICULTURAL PRODUCTION FOR THE FAR EAST AND OCEANIA,
AVERAGE 1961-65 AND ANNUAL 1966-75

Asia Area
Foreign Demand and Competition Division
Economic Research Service

INTRODUCTION

Indices of agricultural production in foreign countries have been prepared since World War II as part of a continuing assessment of the current agricultural situation abroad. During and immediately after the war the effort was focused on Europe. Since the middle 1950's special attention has been given to the less developed countries because of an arrangement with the Agency for International Development whereby the Department of Agriculture prepares annual reports on the volume of agricultural production in most countries which are aid recipients.

The indices presented on the following pages are constructed from production series given in metric tons, extending from 1966 through 1975 inclusive. To the extent possible, commodities were combined on a calendar year basis. Calendar year production includes crops harvested during the spring, summer and autumn of 1966 (for example) and includes some crops such as rice, where the bulk of the crop is harvested in 1966, but continued into the early part of 1967. The base period is the average of the calendar years 1961-65.

The Economic Research Service has revised the indices of agricultural production which appear in this publication to reflect changes recently made in foreign cereal production for the last 25 years. These revisions were made in part to more closely agree with data published by foreign governments. The indices in this report thus supercede those published in the July 1975 Indices of Agricultural Production for the Far East and Oceania, Statistical Bulletin No. 545, and all previous editions.

Country Indices. Country indices are calculated with Laspeyres' base-weighted aggregate formula. Estimated base-period average prices received by farmers, expressed in U.S. dollars per metric ton are used for weighting. When farm prices were not available it was necessary to use wholesale or export prices, adjusting to make them comparable to farm level.

Sources of Data. These indices are based on statistics of widely differing reliability. For most commodities, forecasts of production in the current year are published by Foreign Agricultural Service. These forecasts cover the major producing countries and are subsequently revised by the governments concerned or by FAS. For other commodities (e.g. millet, sorghum, bananas, and cassava), FAS does not publish production statistics and ERS must rely on other sources, such as FAO and foreign governments, for historical data and on estimates, based largely on trends, for the current year. Statistics of livestock products are generally less reliable than figures for output of the principal commercial crops. All production figures are based on the latest information available to this office as of April 1976.

Regional Indices. Indices of agricultural production are computed for three regions: South Asia, East Asia, and Oceania and totals for each region are included in the tables. Several smaller countries are omitted from the calculations for lack of data. The formula for the regional indices is a weighted-aggregate type, the regional aggregates being the sums of the country aggregates. This method is biased in favor of countries with relatively comprehensive commodity coverage or relatively high price weights, but the bias is not serious enough to offset the advantage of great flexibility in the grouping of countries into various alternative regions and sub-regions.

Commodity Coverage. In the country indices all major cash crops and subsistence crops are included if current estimates of their production are obtainable. Hay and other crops grown for feeding on the farm are omitted. Outputs of milk, eggs, poultry meat, wool, honey, and fur skins, if significant, are included to the extent permitted by the quality of the data. Production of meat animals is represented for most countries by estimates of meat production.

Commodity Prices. Prices of agricultural commodities are generally reported in local currencies. Converting to U.S. dollars poses a problem. The currencies of many less developed countries are overvalued in varying degrees in the base-period years 1961-65. To convert with exchange rates at par value would give an unrealistic schedule of prices in U.S. dollars. Prices would be too high in proportion to the extent of currency depreciation. This would not affect the computation of an index for a given country, but it would cause difficulty when combining production of several

countries to obtain a regional index. Thus, conversion of prices to U.S. dollars, using free market exchange rates rather than official rates, offers a more standard basis for regional analysis. For this reason prices in countries included in this publication are converted to U.S. dollars using free market rates reported at Hong Kong. The exchange rates employed are gathered on a monthly basis and averaged over the 5-year 1961-65 base period.

Feed Deduction. For Australia and Japan, the indices of agricultural production regard agriculture as consisting essentially of two farms, one with no livestock which produces only crops and one with grazing land but no crops except hay and forage crops which produces livestock products from pasture and forage, and from feed purchases either from the domestic crop farm or from abroad. Aggregates are shown separately for crops and livestock, referring to the gross output of these two farms. When these two aggregates are combined, a deduction is made for livestock feed to avoid double counting of feed and the livestock products produced from it. This deduction is a fixed percentage of the livestock aggregates and represents the feed purchased by the national livestock farm.

The fixed percentage deduction for feed was derived by dividing the feed bill for the base period (1961-65) by the gross value of livestock output in the same years. The feed bill for the base period was calculated by applying to the grains, potatoes, and other crops fed, the prices received by farmers, with no markup for transportation or compounding. In the case of byproduct feeds, such as bran, oilcake, molasses, and brewers' grains, estimates of prices paid by farmers were used.

Food Production Indices. Index numbers of food production are computed for all countries and for regions. They are derived from the index numbers of agricultural production and differ only by the exclusion of inedible commodities and of coffee, tea, and spices.

COMMODITIES CLASSIFIED AS FOOD

<u>Cereals</u>	<u>Vegetable and Tubers</u>	<u>Fruits</u>
Rice, paddy	White potatoes	Bananas
Wheat	Sweet potatoes	Pineapple
Millet and sorghum	Cassava	Citrus
Barley	Onions	Grapes
Corn	Chillies	Apples
Other grains	Other vegetables	Pears
		Other fruit
<u>Oilseeds and Oils</u>	<u>Livestock Products</u>	<u>Pulses</u>
Copra	Milk	Chickpeas
Peanuts	Eggs	Pigeon peas
Cottonseed	Meat	Other pulses
Rape and mustard seed		
Soybeans	<u>Sugar</u>	<u>Other</u>
Sesame	Sugarcane	Cocoa
Palm oil	Sugar beets	
Palm kernel	Honey
