## **Introduction**

Since 1979, Asia has been the leading regional market for U.S. agricultural products. Rising per capita incomes and the increased popularity of western fast foods is creating a wide range of market opportunities for U.S. food exporters in the Pacific Rim. High value products and convenience foods will be two of the fastest growing markets in Japan and the newly industrialized countries of Taiwan, South Korea, Hong Kong and Singapore. Bulk commodity exports will provide tremendous market opportunities in developing countries such as China, Indonesia, Malaysia and the Philippines.

Increased international pressure is resulting in the liberalization of some trade restrictions for U.S. food products, particularly in Japan. A recent example of Japan's market opening further was the removal of restrictions on rice imports in November 1990. However, a shortage of hard currency and/or large foreign debt obligations, as well as pressures from local groups, are creating new barriers in other nations. The outcome of the

Uruguay Round of the General Agreement on Tariffs and Trade will play an important role in determining the development of future agricultural trade in Asia.

According to the United States Department of Agriculture, analysts estimate that the exports of U.S. fruits and vegetables for fiscal year 1991 are likely to reach an all time high of more than \$2 billion. Leading commodities will include citrus products, apples and grapes. With consumption increasing in the Pacific Rim countries, along with a cheaper U.S. dollar and enhanced promotion in prime markets, both growers and the United States government are optimistic. As a result of Japan's phasing out of import quotas, export of oranges to that country increased by 20 percent in 1990 and is expected to grow by a like amount in 1991. Grapefruit exports continue to grow in Japan, Taiwan, and South Korea while newer markets are being developed in Australia, Indonesia and Thailand. Rapidly gaining ground as an export commodity are apples, primarily from Washington State, in prime markets that include Hong Kong, Taiwan and Singapore but

are also making inroads in to Indonesian and Thai markets. Equally optimistic are U.S. growers of grapes and cherries that are seeking to expand exports to all Asian markets. Export of grains and feedstuffs will vary on a country to country basis.

However, most U.S. agricultural products will face stiff competition in the Asian market during the decade of the 1990s. The major competitors will include Australia, New Zealand, Canada, Chile, the European Community, Thailand and China. Price competitiveness and quality will be two of the critical determinants of the future U.S. market share in Asian markets. Aseptic packaging will help competitiveness of some products in the lesser developed countries, as well as in rural areas of the more developed economies where there is a lack of refrigeration for perishable goods.

The opportunities for food distribution in Asia in the 1990s is highlighted in this article by examining selected countries' economic, social and market trends.

## Japan

### *Overview*

The removal of key trade barriers and the high value of the yen relative to the U.S. dollar have made Japan an important market for U.S. food products in the 1990s. With sales to Japan reaching \$8.2 billion in fiscal year 1989, Japan replaced the European Community as the largest market for U.S. agricultural exports.<sup>1</sup> Substantial growth is anticipated in the markets for bulk commodities, frozen and convenience foods, and fresh fruits and vegetables.

### *Economy*

In 1989, Japan was the world's second largest economy with a GNP in nominal terms of \$2.9 trillion.<sup>2</sup> Japan's population of 123,642,461 people is projected to grow at an annual rate of 0.4 percent through the remainder of the decade.<sup>3</sup> Less than 7 percent of Japan's labor force is engaged in agriculture. Domestic agriculture accounts for 3 percent of the gross national product

and supplies 71 percent of domestic food requirements.<sup>4</sup> Approximately 20 percent of disposable income in Japan is spent on food, compared to 12 percent in the United States.<sup>5</sup>

### *Trade*

In 1989 Japan accounted for 21 percent of all U.S. agricultural exports.<sup>6</sup> Wheat, corn, soybeans, fruits, beef and veal were among the major U.S. exports to Japan. Japan's restrictive trade policies, import quotas, domestic price supports and tariffs have created sizeable barriers to market entry over the past three decades. While the ban on the import of rice is traditionally viewed as a matter of national security, there are indications of a general trend towards liberalization of all agricultural trade, particularly with the recent changes in policy on rice.

The impact of the 1988 U.S.-Japan Beef and Citrus Agreement has been significant. Quotas on imports of citrus and beef will be phased out by 1991. As a result, the U.S. share of beef imports rose from 58 percent in fiscal year 1987 to 73 percent in fiscal year 1989. Orange juice imports rose from 4 percent to 14 percent in the same time period.<sup>7</sup> Both markets represent growth opportunities for U.S. exporters, although there will be competition in the beef market from Australia and citrus products from Latin America.

Japan bought \$200,000 of U.S. ice cream from 1985 to 1989. Quotas for both ice cream and frozen yogurt were eliminated on April 1, 1990 although tariffs of at least 25 percent remain. Removal of the quotas opens the market to further expansion in the 1990s.<sup>8</sup>

Imports of processed wheat-based products are also increasing due to the high rice support prices set by the Japanese government and to the low quality of domestic wheat. Imports of cake mixes and doughs from the United States rose over 25 percent in 1989 and accounted for almost 30 percent of the Japanese market.<sup>9</sup>

### *Market*

There is great potential in Japanese markets for U.S. high value and value-added processed

food products. Higher per capita income and changing lifestyles increased the market opportunities for fast-foods and microwave convenience foods. Demand for red meats, poultry, dairy products, fruits and convenience foods has risen due to changes in the Japanese diet.

Quality, packaging and product uniqueness are highly emphasized in the Japanese markets. Lithographed cans and several layers of packaging are standard in the processed food markets. Packaging is of particular importance in the gift market. The year-end and summer gift seasons account for roughly \$11 billion in sales of food and beverages annually. The value of U.S. wine imports increased 61 percent in 1988, followed by an additional increase of 9 percent in 1989.<sup>10</sup> Investment in promotional campaigns, in-store demonstrations and point of purchase materials assure better distribution among retailers, particularly supermarkets.

The traditional multi-tiered distribution system in Japan is breaking down, in part due to its slowness in passing on the benefits of a strong yen in the form of lower prices on imported goods. The food service sector has been most receptive to the marketing efforts of U.S. exporters on a volume basis. This sector has a high strategic value as it often sets the trends which later influence home consumption patterns.

The mass retail market in Japan, which is largely untapped by U.S. exporters, offers the greatest long-term potential for growth. New companies along with supermarkets, department stores and other retailers are directly importing more food products. Competition in this market is stiff, but the lower costs of U.S. imports makes it an attractive niche. If exporters are to be successful in the Japanese market, it is essential that they learn and understand the unique market structure, channels, customs and culture as they attempt to penetrate this growing and lucrative market.

## Republic of Korea

### *Overview*

Agricultural exports to South Korea in 1989 totalled \$2.45 billion, making it the fourth largest market for U.S. goods.<sup>11</sup> U.S. exports of soybeans, cotton, corn and hides are expected to rise in the future. Changes in import restrictions and quotas could also lead to increased demand for beef, fruits, vegetables and nuts. Bulk commodities continue to dominate Korea's agricultural imports with the highest growth potential seen in consumer and high value products.

Korea's real GNP growth slowed to close to 7 percent in 1989, sending a ripple through the economy after three years of double digit growth rates. The Bank of Korea cited the negative growth in exports due to won appreciation, increased wages and production losses resulting from labor disputes as the underlying cause of the fall in GNP growth.<sup>12</sup> Future agricultural imports could be limited if Korea's long-term debt increases and if economic growth continues to slow down.

### *Economy*

In 1989, per capita GNP was \$4,600 with a real growth rate of 6.5 percent. Agriculture accounted for 11 percent of GNP.<sup>13</sup> Korea's Economic Planning Board forecasts economic growth of 8 to 9 percent in 1990.

In spite of this upturn, the Board also anticipates that Korea will have a trade deficit of \$500 million this year, the first since 1986. Lagging exports and brisk import growth were cited as reasons for the deficit.<sup>14</sup> Export growth dropped from 28 percent in 1988 to 2.8 percent in 1989 with continuing decreases in 1990 due to labor disputes and currency appreciation. In 1989 imports rose by 18.5 percent with bulk commodities and industrial raw goods making up more than 90 percent of imports. Indications are that the rate of growth for bulk commodities will continue to slow down. High-value product imports are expected to increase.<sup>15</sup>

The average annual growth of population in Korea was 1.2 percent from 1980 to 1988 and is projected to be 0.9 percent annually to the year 2000.<sup>16</sup> The current population of Korea is 43 million. Increased industrialization of Korea has led to a decline in the agricultural labor force. At present, approximately 20 percent of the population is engaged in farming.<sup>17</sup> As in Japan, women account for 40 percent of the workforce.

### *Trade*

Korea's major agricultural imports are bulk commodities such as wheat, corn, soybeans, cotton and raw hides. South Korea is also expected to be a major buyer of U.S. corn in 1990. Most of these products will be used in the manufacture of export goods.

International and domestic politics continue to dominate Korean agricultural policies. In April, 1989 Korea announced an agricultural agreement opening its markets to 243 products from the United States with liberalization occurring in three stages over the following two years. While a few market opportunities were created, the existence of other non-tariff barriers greatly limited the impact of the agreement.

The four-year beef import ban ended in August, 1988 with implementation of quotas and the establishment of the quasi-governmental Live-stock Product Marketing Organization as the sole purchaser. The Korean government also implemented a five year liberalization plan for imported wine in January of 1989 following the filing of a Section 301 of the U.S. Omnibus Trade Act petition by the U.S. government.<sup>18</sup>

Korea has agreed to give up Balance-of-Payments restrictions on imports by 1997. This is of particular significance in the agriculture sector and should, over time, enhance market access.

### *Market*

While bulk commodities such as wheat, cotton, corn and cattle hides make up nearly 98 percent of Korea's agricultural imports, the prospect for these markets is mixed. Export value and

volume of these commodities have fluctuated, and the growth rates vary significantly.<sup>19</sup>

Rice, corn, barley and soybean production are heavily subsidized by the Korean government. Korea is self-sufficient in rice and, like many other countries with rice subsidy programs, Korea faces unmanageable surpluses of rice. The future trade prospects for these commodities is mixed.

The greatest potential for U.S. food imports is in the high-value market. In 1988 high value foods accounted for only 1.4 percent of the market, but experienced the largest percentage increase for U.S. agricultural exports in 1989. A strong Korean economy has created high demand in urban areas for consumer ready products such as meat, confectionery goods, and fresh and processed fruits and vegetables. The young internationally minded consumer market is quite large. Approximately 65 percent of Korea's population of 43 million is 30 years old or less. Competition for the Korean market is growing with several countries focusing product promotion on fresh fruits and nuts, juices, chocolate and wine.<sup>20</sup> Lack of product awareness, high tariffs, quotas and strict phytosanitary regulations are some of the barriers to market entry. Creative non-tariff barriers are likely to be developed as Korea's current trade restrictions fall under international pressure.

The Citizen's Alliance for Consumer Protection of Korea (CACPK), an anti-import movement, which caused a severe drop in sales of U.S. grapefruit in 1989, will continue to focus on the high-value import market. In the aftermath of the June 1989 charges by CACPK that U.S. grapefruit contained traces of Alar and were therefore unsafe, total sales of U.S. grapefruit to Korea has dropped 67 percent from 1989. There are currently eight grapefruit importers, a sharp contrast to the 35 to 40 importers in 1989.<sup>21</sup>

### **Taiwan**

#### *Overview*

As personal incomes rise and the fast food industry grows, consumer demand for imports will increase. If Taiwan continues to liberalize

trade restrictions, strong growth is expected in wines, high quality beef and feed grains. Taiwan was the seventh largest market for U.S. agricultural imports in 1989 with purchases of \$1.59 billion.<sup>22</sup> Forty-one percent of Taiwan's agricultural imports in 1987 were from the United States. The U.S. Department of Agriculture predicts that Taiwan will become the second leading market in the world for U.S. agricultural products in the future.<sup>23</sup>

### *Economy*

Taiwan's gross national product was \$121.4 billion in 1989 with a real growth rate of 7.2 percent. Taiwan's population is currently 20,546,664 with a projected growth rate of 1.1 percent.<sup>24</sup>

Agriculture accounted for 6 percent of the gross national product and employs 20 percent of the labor force, including part-time farmers.<sup>25</sup> Rice, sugarcane, sweet potatoes, fruits and vegetables are Taiwan's major crops. Taiwan is self-sufficient in poultry, hog and rice production. Beef, milk and cattle are also important sources of agricultural revenues.

Rural population is expected to decline from over four million to 900,000 by the year 2000.<sup>26</sup> Labor shortages, currency appreciation and pollution pose serious problems to Taiwan's agricultural industry. In 1989 the agricultural sector experienced a growth rate of negative 0.9 percent.<sup>27</sup> Agricultural imports were 12 percent of total imports in 1989, with the United States supplying 95 percent of those imports.<sup>28</sup>

### *Trade*

Taiwan is highly vulnerable to U.S. trade retaliation as much of its export driven economy is dependent on U.S. markets. Good trade relations and open markets for Taiwan's products are of great importance to Taiwan since it has diplomatic relations with only a handful of countries.

The main barrier to U.S. entry in Taiwan's agricultural markets is high tariffs. As the United States has become increasingly vocal, Taiwan has made some moves towards liberalization of trade

restrictions. Positive developments include Taiwan's interest in joining GATT, OECD, and other international economic organizations.

### *Market*

Taiwan's top five imports in descending order were logs and lumber, corn, soybeans, cotton, milk powder and formula.<sup>29</sup>

The United States has dominated the market for soybeans in recent years with a 95 percent or greater market share. Growth in soybean imports is expected throughout the 1990s.<sup>30</sup>

Taiwan depends solely on imports for its wheat. The United States dominates the market with 85 to 95 percent of wheat imports. As dietary preference shifts away from rice, consumption of wheat is increasing and imports of wheat are expected to rise in the 1990s. However, the bulk commodities market in general is expected to shrink in the near future due to increased competition.<sup>31</sup>

Rising consumer incomes, the shift towards a service/industrial economy and the rapid growth of fast food restaurants and grocery stores make high value agricultural products the imports of the future. Areas that are estimated to be the most successful are special beef cuts, deciduous fruits and fruit juices and convenience foods. These are all products that Taiwan cannot produce competitively.

The Taiwanese have large discretionary incomes and there is a trend towards more westernized eating habits. Western style steak houses are enjoying increased popularity. The United States remains Taiwan's sole supplier of high quality beef, although Australia entered the market in 1989 in Taiwan's top supermarkets.<sup>32</sup> The reduced tariffs for high-quality beef have given the United States and added advantage.

There are over 500 convenience outlets in Taiwan and the supermarket and minimarket industries are booming. Taiwan has 70 supermarkets, about 80 percent of which are in Taipei with a majority of the remainder in the port city of Kaohsiung. Direct importing by larger supermar-

kets is an emerging trend. Supermarkets are increasing their freezer chest capacity to accommodate the new-to-market microwave foods and other consumer ready items. For the past five years, Taiwan has been one of the largest Asian markets for U.S. ice cream along with Hong Kong and Singapore. Taiwan's annual imports of ice cream averaged \$330,000 from 1985 to 1989. Market potential also exists for exports of yogurt.<sup>33</sup>

Snack items such as popcorn and french fries are also gaining in popularity. The snack food and juice markets are two areas of potential expansion. Consumers are moving towards more natural fruit juices and the United States is a likely candidate for this market although the juice standards are very rigid.

High value food products face stiff tariffs. Import control is also practiced through the use of health regulations, and arbitrary import licensing practices. Bans exist on the imports of fresh offal, peanuts, rice, chicken meat, wheat flour and fresh milk.

Imports of wine and beer have high monopoly taxes and are still subject to restrictive advertising and promotional provisions. Wine has an effective tariff rate of nearly 225 percent, grapefruit and other citrus fruits 50 percent, and microwave popcorn and sugar confections 40 percent. In May of 1989 Taiwan proposed to reduce the nominal average tariff rate on agricultural product imports from a 25.99 percent average to 19.75 percent by 1992. Fresh fruit and most value-added products would likely not be affected.

In late 1991, Taiwan will decide if the United States will be designated a codling moth-infested area. Taiwan is currently the leading U.S. apple importer, and such a finding would eliminate apple exports to Taiwan.<sup>34</sup>

Agricultural trade issues have contributed to the rise of an independent farm movement. In 1988 large violent demonstrations were staged in Taipei by the nation's first nongovernmental farm federations. Despite the high food prices resulting from trade protectionism, the activist movement

enjoys popular support and is a factor to consider when entering Taiwan's market.

## Hong Kong

### *Overview*

Hong Kong offers many opportunities for U.S. agricultural products, particularly as western food becomes more popular and as incomes rise. Since fiscal year 1985, imports of U.S. food products have been increasing.<sup>35</sup> The United States has close to 20 percent of the food export market to Hong Kong and is the number two supplier.<sup>36</sup> Price competitiveness and product quality will be the key to maintaining a good market share. Price competition will come from nations with cheaper freight rates such as New Zealand, Australia and other Asian nations. Fruits, vegetables, high quality beef, ginseng, convenience and prepackaged foods are among the high value products that promise expanding markets. Future U.S. bulk commodity markets look less growth oriented with the possible exception of wheat. Furthermore, with Hong Kong being transferred to the People's Republic of China in 1997, thus losing its independent status, the outlook is very uncertain as its future status has not been fully established.

### *Economy*

Per capita income in Hong Kong is the second highest in East Asia, just after Japan.<sup>37</sup> In 1989 the population of Hong Kong was 5.8 million, with an annual growth rate of 1.2 percent.<sup>38</sup>

Hong Kong imports almost 90 percent of its food requirements. In 1989 Hong Kong imported \$615 million of U.S. foodstuffs. Hong Kong citizens buy more American food products than any other country in the world outside of the United States.<sup>39</sup> Agricultural exports to Hong Kong accounted for 11.65 percent of the total value of all U.S. exports to Hong Kong. Food prices in Hong Kong are kept low by import policies that provide an efficient market and good infrastructure for agricultural products.

Chinese rule over Hong Kong will resume in 1997. This may provide new opportunities for

U.S. agricultural goods in South China as China has pledged to maintain Hong Kong's free market system for fifty years. China's own internal demand and its transportation problems are likely to prevent it from supplying agricultural products to Hong Kong in the early 1990s. However, this situation could change as the September meetings of the Standing Committee of the People's National Congress have placed priority on infrastructure development, particularly in South China and the adjacent coastal area, China's breadbasket, to better connect the rest of the country.

### *Trade*

Hong Kong imported a record US\$615 million of U.S. agricultural products in 1989. Hong Kong has relatively few barriers to trade. It is a duty free port and generally accepts USDA and FDA standards and inspection certificates. Tariffs are imposed on alcoholic and nonalcoholic beverages as well as on cigarettes and tobacco.<sup>40</sup>

Hong Kong is an important entrepot center for southern China and for other Asian countries. In 1987 Hong Kong's Kwai Chung container port overtook Rotterdam as the busiest in the world in terms of container throughput. Hong Kong is a transshipment point for the booming economies of Thailand, Singapore and Indonesia. With a new airport planned and with current port expansion, Hong Kong is likely to remain one of the best sites in Asia for providing the telecommunications, business and transportation services needed to support trading operations.<sup>41</sup>

### *Market*

The United States has a 90 percent share of the wheat export market to Hong Kong. Per capita wheat consumption in Hong Kong is higher than that of other Asian nations. Imports of wheat flour have been increasing and it is unclear what effect this will have on the growing market demand for wheat based products such as noodles, spaghetti and macaroni.

Hong Kong's high standard of living and strong tourist industry makes it a lucrative market for high value added products, particularly high quality beef, convenience foods, fruits and vegeta-

bles, ginseng, eggs, wine and beer. The growing number of fast food restaurants have increased demand for frozen chicken exports. Strong upward movement in this market indicates additional opportunities for expansion. Australia, South America and the European Community will be prime competitors in this market.

The outlook for fresh fruit is equally promising. Price competitiveness and high quality have assured a good market for U.S. fruit although increased competition will come from China, Taiwan, Chile, South Africa, Australia and New Zealand. "In Hong Kong, we eat more California and Florida oranges per head than anyone else in the world, including the United States," says Mr. Andrew Ma, assistant director of the Hong Kong Trade Development Council. "It leaves a very good taste in the mouth for our U.S. trade relations."<sup>42</sup>

In 1989 Hong Kong was the leading importer of U.S. ice cream with \$2.6 million and a 27 percent share of the market sale by country. Since 1985 Hong Kong imported an average of approximately \$2 million annually of U.S. ice cream.<sup>43</sup>

Hong Kong residents shop daily and generally prefer fresh to frozen foods. Traditional "wet" markets account for roughly half of consumer food shopping, with the other half attributed to modern supermarkets. Supermarkets are quickly gaining in popularity over the traditional markets. There are now more than 600 supermarkets and convenience stores in Hong Kong.

The entrenched suppliers of the British-controlled food chains provide a competitive environment, but recent successes have been made by U.S. companies introducing products through the increasing number of Chinese-owned food chains and through promotions in the big Japanese department stores. The Japanese-owned department stores/supermarkets are becoming more popular and are expanding. Japanese stores generally do not charge shelf fees to the suppliers of new products, while the two largest supermarket chains charge steep shelf fees, as high as US\$128,000.<sup>44</sup>

## Singapore

### *Overview*

Good marketing, competitive pricing and quality packaging will determine the future U.S. market share of Singapore's agricultural imports. Singapore's rising standard of living has made competition stiff for high value products. According to a 1988 U.S. trade mission to Singapore, products that are targeted to the Asian market will be the most successful. Demand for bulk commodities is likely to be flat with nearby Asian countries competing with lower prices.

As the gateway to Southeast Asia, Singapore is a key market. Many of the products that sell successfully in Singapore are re-exported by Singaporean importers to Indonesia, Malaysia, Thailand and the Philippines.

### *Economy*

Gross domestic product rose to \$27.5 billion in 1989, with a slower growth rate of 9.2 percent over the 11 percent growth of the preceding year.<sup>45</sup> Singapore's population is 2,270,915 with a growth rate of 1.3 percent.<sup>46</sup> The annual growth rate of Singapore's population to the year 2000 is estimated at 1.0 percent.<sup>47</sup> The agricultural sector accounts for 1.2 percent of the labor force.<sup>48</sup>

### *Trade*

Singapore is a free port with duties on a few "luxury" items such as wine, alcohol, chocolates, sugar-based confectionery and tobacco. Singapore serves as a transshipment port for some high value products destined for Indonesia and other South Asian countries. Singapore aims to use its comparative advantage in services and infrastructure to take advantage of the developmental need of the region in the 1990s.

### *Market*

Higher per capita income, changing life styles and the decline of traditional "wet" markets has created strong opportunities for U.S. food products. Supermarkets and convenience stores

are aggressively competing with the traditional "mom and pop" provision shops. Western fast foods and microwaveable products are increasingly popular.

According to Geoffrey Wiggin, the U.S. agricultural trade officer in Singapore, good growth markets exist in poultry and poultry parts in particular. Mr. Wiggin believes that the U.S. exporters should exploit their technological advantage in microwaveable, high quality food items. He also points out that several U.S. vegetables are unknown in Singapore. With consumer education, increased marketing, and particular care to the problems of packaging perishable food items, the vegetable and fruit markets could also expand.

The U.S. reputation for high quality gives U.S. exports a marketing edge. Mr. Wiggin stressed the importance of maintaining a good relationship with a Singaporean importer and of providing marketing support for the development of product sales.<sup>49</sup> The limited number of distributors and their prohibition from taking on competing product lines once exclusive franchises are obtained poses a serious constraint to U.S. exports.

Increased competition for Singapore's import markets is coming from Japan, Australia and New Zealand. Dedication to customer relations, aggressive marketing and a focus on long term gains characterize Japan's competitive edge. Australia and New Zealand's advantage is in lower transportation costs due to both proximity as well as the lower cost of containerized vessels because of more competitive rates offered by Asian shipping lines. Wheat and fruit and vegetable sales to Singapore are facing increasing competition from Australia. Thailand dominates the corn market and also supplies most of Singapore's rice.

The top U.S. export item to Singapore traditionally has been frozen chicken parts. High quality beef, wine fresh fruits, packaged foods, confectionery and bakery items along with other high value food products look the most promising. U.S. ice creams exports to Singapore averaged just over \$300,000 annually from 1985 to 1989.

Singapore is also one of the leading markets for U.S. yogurt.<sup>50</sup>

In 1988 the U.S. Agricultural Trade and Development Mission offered the following advice to high value exporters to Singapore. Increased tourism is creating a strong demand in Singapore for western products. U.S. exporters who want to capitalize on this market must develop products with the Asian customer in mind. Kentucky Fried Chicken success is due to their development of a special formula for Asian customers. Furthermore, brand name goods need to be represented by the manufacturer face to face, rather than through a broker. The mission also noted that buyers reported being unable to reach U.S. sellers to place orders. Efficient follow-up and attention to logistics and packaging could greatly increase the U.S. market share in Singapore.<sup>51</sup>

Mr. G. Salvadas, First Secretary of the Singapore Embassy in Washington, D.C., suggested that Singapore's annual three to four million airport passenger arrivals makes the market for airport meals highly lucrative. He also mentioned Singapore's active international port and the replenishment of ship stores as a possible market for U.S. food exporters.<sup>52</sup>

## **People's Republic of China**

### *Overview*

In 1989 China was the eighth largest market for U.S. agricultural exports at \$1.48 billion. China's import demand has varied widely. From 1983 to 1988 its agricultural exports have exceeded imports.<sup>53</sup> In some commodities such as cotton, rice, soybeans and corn, China has become a major competitor. Nevertheless, U.S. export sales to China are expected to reach \$1.2 billion in 1990.<sup>54</sup> Projected shortfalls of corn and wheat production in the next few years could create export opportunities for the United States. China's possible entrance to GATT will impact the patterns of future agricultural trade.

### *Economy*

In 1989 China's gross national product grew 3.9 percent. Total exports from the United

States were \$5.8 billion, with grain sales increasing 61 percent.<sup>55</sup> Per capita income in 1989 was US\$340.<sup>56</sup> As of July 1990, China's population numbered 1,118,162,727 with a growth rate of 1.4 percent.<sup>57</sup> China's population growth is projected at an average annual rate of 1.3 percent to the year 2000.<sup>58</sup>

Sixty-one percent of China's 513,000,000 labor force is engaged in agriculture and forestry. China is basically self-sufficient in food with agriculture accounting for 26 percent of GNP. China is also among the world's largest producers of rice, potatoes, peanuts, tea, barley and pork.<sup>59</sup> However, agricultural development in China is constrained by a weak infrastructure.

### *Trade*

The availability of foreign exchange and China's trade policies limit the number of imports to China. Bulk commodities make up almost 95 percent of China's agricultural imports.<sup>60</sup> Trade restrictions to China come in the form of import licensing, tariffs, and quarantine regulations to protect domestic production.

### *Market*

Wheat, sugar and vegetable oil are among the top imports to China. In 1988, the United States shipped 6.6 million tons of wheat valued at \$697 million to China. High value imports were estimated at \$350 million in 1988. Growth prospects for high value products through the early 1990s are bleak. Most of the outlets for these products are international tourist hotels, Friendship Stores, local tourism administrations and the expatriate community. The retrenchment policy begun in the fall of 1988 precipitated a sharp drop in tourism and foreign investment. Recovery is expected to be slow.<sup>61</sup>

Competition in the high value meat market supplying hotels will come from Australia, New Zealand, Western Europe and a Sino-German venture outside of Beijing. Some interest has been expressed in high quality fruits but quarantine regulations prevent market penetration. The removal of the Mediterranean Fruit Fly in the United States may lead to a revising of the Chi-

nese quarantine restriction on U.S. fruit. Some hotels have the right to import directly from Hong Kong brokers, but most must use the China National Cereals, Oils, and Foodstuffs Import/Export Corporation (CEROILS) or their local Tourism Administration. All alcoholic beverages must be imported through CEROILS and the markup is generally 200 to 300 percent.

South China offers the greatest potential for U.S. exporters. As one of the most dynamic and independent regional markets, Guangdong will be a particularly strong market for high value products. Per capita income in South China tends to be several times higher than the national average and exposure to western tastes is greater. Foreign products are viewed as a status symbol and those goods with a long shelf life, such as candy, nuts, snack foods, canned goods and beverages, represent enormous market potential.

## **Thailand**

### *Overview*

Thailand is currently the 38th largest market for U.S. agricultural exports. Thailand has a strong agricultural history and remains the world's top rice exporter. Other major Thai crops include tapioca, maize and sugar. Thailand's agricultural policy is geared towards export growth and import substitution. However, Thailand's boom economy has created a growing middle and upper middle class and an increasing demand for western food products.<sup>62</sup>

### *Economy*

Thailand's economy grew 10.8 percent in 1989, giving Thailand the best economic performance in all of Asia.<sup>63</sup> This rapid growth is one of the reasons Thailand is believed to be the next Newly Industrialized Country (NIC) in Asia. Still, the 1989 per capita GNP of \$1,179 is less than one-third of South Korea's and 13 percent of Singapore's.

The population of Thailand is 56 million with an annual growth rate of 1.7 percent.<sup>64</sup> Eighteen percent of Thailand's work force is employed in agriculture.<sup>65</sup> The agricultural sector

accounted for 14.2 percent of the gross domestic product in 1990, down from 39.8 percent in 1960.<sup>66</sup>

Thailand imported \$1.62 billion of agricultural products in 1989. The United States accounted for approximately 15 percent of the total imports.<sup>67</sup>

### *Trade*

In 1989 total U.S. exports to Thailand were \$190 million, a 13 percent increase from 1988.<sup>68</sup> Major exports to Thailand were wheat (\$21 million), dairy products (\$10 million) and fresh apples (\$7 million).<sup>69</sup>

Trade barriers exist in the form of tariffs, import controls, quotas, licenses and prohibitions. Luxury items and products perceived to compete with domestic goods face greater restrictions. Imported fruit (excluding apples) and convenience foods are taxed at 60 percent or greater.<sup>70</sup> In 1988 the Thai government reduced the import tariffs on wheat by 57 percent and on apples by 88 percent. The Thai government's standards, product testing, labeling and certification requirements are perceived by most importers as obstacles equal to or greater than the tariffs.

Thailand's weak infrastructure and the limited capacity of the port of Bangkok have made transportation problems a key factor in exporting to Thailand. The new deep sea port at Laem Chabang in Chon Buri province is scheduled to be completed in late 1990 or early 1991 and will serve Thailand's northeastern agricultural provinces. Laem Chabang will also have large container facilities. In the future, these facilities may lessen Thailand's dependence on Singapore as a transshipment port, and may eliminate the limited size shipment restrictions on exports.<sup>71</sup>

### *Market*

Thailand's growing middle class and tourism industry is increasing the popularity of fast food restaurants. The restaurant and food service sector will be an important market for U.S. exporters. Areas of possible export growth include beef, turkey, canned and dried fruit, condiments

and specialty items. U.S. frozen potatoes are another potential market, but the Thai government has restricted this market by using high tariffs and taxes on imports to protect the local producers of potatoes.

Changing shopping styles has encouraged the growth of supermarkets, mini-markets and convenience stores. High value and microwave products have strong market potential. Thais traditionally eat large quantities of fresh fruit. U.S. fruit is perceived to be of better quality than local fruit and is often given as gifts during holidays. The United States has a large market share in apples, cherries and grapes. The citrus market is closed to U.S. imports, but if trade restrictions were revoked, it would become an important market.

There is also little production of frozen food items in Thailand and the increase in refrigerator ownership will lead to an increase in demand for frozen items. Quality remains an important issue in all food exports. Although Thailand produces the majority of its food needs, inconsistent quality has led to a preference for imported items.

Another potential market for U.S. agricultural products is the growing food processing industry in Thailand. Bulk shipments of fruit juice, vegetable oil, peanut butter and wine are currently being packaged in Thailand for the local retail market and for re-exportation in Asia. Opportunities exist for U.S. companies interested in joint ventures, licensing and repackaging agreements with the Thai food processing industry.<sup>72</sup>

## **Indonesia**

### *Overview*

Indonesia's emerging economy, large workforce and stable political environment make it an attractive market for the U.S. food industry. Opportunities exist for U.S. firms interested in developing the food processing sector in Indonesia as well as the high value food market. As a key developing country, Indonesia has a wide variety of agricultural and food product needs: from basic commodities to consumer ready products. Indonesia's persistent debt problems limit its ability to

purchase U.S. agricultural products. The current situation in the world oil market may benefit Indonesia's economy. Once the world's largest rice importer, Indonesia is nearly self sufficient in rice and the government continues to encourage growth in the agricultural sector.

### *Economy*

Indonesia's agricultural imports from the United States totaled \$231 million (FOB) in 1989, up from \$224 million in 1988. Cotton accounted for almost half of U.S. exports to Indonesia. Soybeans and wheat were significant exports.<sup>73</sup>

With a population of 190 million and an annual growth rate of 1.8 percent, Indonesia is one of the largest countries in the world. Approximately 70 percent of Indonesia's population lives in rural areas. Annual per capita income in 1989 was about \$550. Agriculture accounts from roughly 22 percent of the gross domestic product in Indonesia. Over half of the labor force of 67,000,000 is employed in the agricultural sector.<sup>74</sup>

### *Trade*

Indonesia's Fifth Five Year Development Plan (REPELITA V) of April 1989 stresses increased agricultural output, both for domestic consumption and export, and expansion of the food processing industry. Government policy controls the trade of wheat, sugar, soybeans and soybean meal. For wheat and corn, the United States serves as a "residual supplier," selling when competitors closer to Indonesia are undersupplied. The United States does have the advantage in the soybean market, being perceived as a high quality supplier. The import of fresh fruit and vegetables, as well as processed food products, is controlled by government appointed private companies. In 1988 trade in orange juice, processed meats and roasted nuts was liberalized. Future liberalization of trade restrictions on high value products is likely in the coming year. With about half of the population under the age of 15, job creation, particularly in labor-intensive industries, is one of the many challenges facing the government.<sup>75</sup>

## *Market*

Consumption of wheat continues to grow, with wheat imports to Indonesia reaching a record high in 1989. Noodles account for approximately 45 percent of wheat consumption; baked products 25 percent; and snack foods ten percent. Australia and Canada are major competitors in the wheat market and can usually offer lower freight rates.<sup>76</sup> Increases are expected in the demand for soybeans due to decreased production, an increasing domestic feed industry and food consumption. The People's Republic of China is the leading importer of soybeans, followed by the United States. Price competitiveness is a major determinant of market share in bulk commodities.

High value products represent a potential market for U.S. food exporters. An estimated two to five percent of the population are considered to have sufficient incomes to afford high value products. This represents a potential market of over seven million adults. Occasional purchasers of these products would increase the market even further. Substantial trade in high value foods already exists in Indonesia, despite current government restrictions. Fresh fruits, vegetables, beef, convenience foods, wines and packaged products are prime candidates for market expansion. Some U.S. food products are already well known in Indonesia, and in general they have a good reputation for quality.<sup>77</sup> Competition in these products will come from a variety of nations. Singapore is the main competitor for fresh fruits, while New Zealand competes in the market for red meat and dairy products.

Two state trading companies have exclusive import rights to a number of high value products, significantly restricting the market. Distinctions between importers, retailers and wholesale distributors are not always clearly drawn. Indonesia's largest grocery chain is active in all three areas.<sup>78</sup>

## **Malaysia**

### *Outlook*

Malaysia should continue to see widespread growth in the 1990s although its high dependency on exports makes it vulnerable to recessions in

other countries. Import demand in Malaysia remains strong for bulk commodities such as soybeans, corn and wheat. Expansion in the domestic livestock industry will increase demand for imports of agricultural feed products. The continued recovery of the Malaysian economy strengthens the outlook for imports of high value and consumer ready processed foods.

### *Economy*

A major objective of the Malaysian government is the eradication of poverty and economic restructuring. Agriculture remains a vital part of the economy and is being linked with rural economic development. Malaysia has a population of 17,510,546 with an annual growth rate in 1990 of 2.3 percent.<sup>79</sup> In 1989 real gross domestic product increased by 8.5 percent in Malaysia. Agriculture accounted for more than 20 percent of GDP, and employed approximately 28 percent of the total workforce. Malaysia is a net exporter of poultry and pork, and produces almost 60 percent of the world's palm oil. Recent efforts in the United States to require food labels that specify palm oil as a saturated fat brought charges of protectionism from Malaysia.<sup>80</sup>

### *Trade*

Malaysia has an open, trade based economy with no nontariff barriers. Agricultural imports to Malaysia accounted for ten percent of total imports in 1989, with a 21 percent increase in value over the preceding year. The largest import category was cereal grains, followed by dairy products and raw sugar. Preliminary indications are that U.S. agricultural exports to Malaysia declined in 1989 and U.S. market share dropped to only 7.0 percent. A large portion of this decline reflects the sharp drop in imports of U.S. corn. Price competitiveness with Argentina will determine the outcome of the U.S. market share for corn.<sup>81</sup>

Imports of wheat flour are not permitted in Malaysia and domestic demand is met by imports of wheat for milling. Concerns about foreign material and protein deficiencies in American wheat led to a drop in U.S. wheat imports to Malaysia. Australia is the main competitor in the

wheat market, but demand for U.S. wheat is expected to rise.

Malaysia imports 60 percent of its beef for consumption, and beef imports are increasing steadily. India is the main supplier of low quality beef, with Australia, New Zealand and the United States competing in the high quality beef market.

High import duties restrict the trade of several U.S. agricultural products. Total taxes on high value agricultural imports are usually equal to 30 to 50 percent ad valorem.

### *Market*

Malaysia's continued economic growth has led to a rapid expansion of the retail food sector. Recently opened supermarkets are increasing the demand for imports of processed and high value foods with in-store promotions. American-style pizza, hamburger and doughnut fast food outlets are becoming even more popular. Domestic consumption of bread, wheat noodles and biscuits is also increasing.

Opportunities exist for the export of fresh and processed fruits and vegetables, fruit and vegetable juices, and canned fruits. Apples, grapes, almonds, wine, beef and frozen french fries are some particular items that have great market potential.<sup>82</sup> While many U.S. products are disadvantaged due to long shipping times, strong marketing plans, innovative promotions and an emphasis on quality can help overcome this handicap.

Advertising for food products in Malaysia is undergoing revision. Consumer interest groups have succeeded in persuading the government to issue new guidelines on advertising, after objecting to the television ads promoting "junk" foods to children. After October 1, 1990, all ads for any food or drink products that claim specific health or nutritional benefits will have to be approved by the Ministry of Health.<sup>83</sup> The United States has not been as competitive in advertising their products as Australia. Australia's promotional efforts include ads in Malay, Chinese and English language newspapers as well as in-store food samplings and food festivals at major hotels.

The bulk of the food distribution system in Malaysia is handled by the private sector, with importers distributing to supermarkets and grocery chains. Some of the larger supermarkets are also starting to directly import products.

Logistical convenience makes most transshipments pass through Singapore, although the Malaysian government offers a ten percent duty rebate on imports coming directly to Asian ports. Malaysia's infrastructure is sufficiently developed to make internal distribution efficient.

### **Philippines**

#### *Overview*

Inflation and high interest rates may slow down the recovery of the Philippines' economy in the short run, but the long term prospects for growth are more promising. The Philippines is a net agricultural exporter whose principal imports are cotton, wheat, soybean meal, tobacco and dairy products. Limited purchasing power and a heavy debt burden will constrain the Philippines' ability to purchase imports. Inadequate infrastructure poses a serious constraint to the economic development of the Philippines.

#### *Economy*

The Philippines imported and estimated \$319 million of U.S. agricultural imports in 1989, which accounted for 29 percent of the \$1.1 billion total Philippine agricultural imports. Imports of major U.S. products were valued on a FOB basis as follows: wheat, \$174 million; soybean meal, \$18 million; fresh fruit, \$10 million; and dairy products, \$4 million. The largest increase in imports from the United States was in fresh fruits.<sup>84</sup>

Philippine gross national product grew by 5.6 percent in 1989. Per capita income was \$740 in 1989 and over half of the country's 60 million citizens live in poverty. Agriculture accounts for 27 percent of the GNP and employs roughly half of the workforce. Major crops include rice, coconut and corn.<sup>85</sup>

The largest agricultural import from the United States is wheat. It is the Philippines' second largest agricultural import. In 1989, U.S. wheat accounted for 72 percent of the Philippines' import requirements, which is less than in previous years. The ability to maintain competitive prices will determine the future of the United States' market share. Increased consumption of wheat has led to a proposal to construct an additional eight flour mills in the Philippines and will cause an expansion in the market for wheat.<sup>86</sup>

Significant barriers to the import of certain high value foods were decreased by the Import Liberalization Program of the government. High value products, in general, face ad valorem taxes of an average of 50 percent. Imports of several major agricultural products, such as rice, corn, and other feed grains, are still significantly restricted. Bulk items are subject to tariffs ranging from ten percent to 30 percent ad valorem.<sup>87</sup>

### *Market*

Most food purchases are still made in traditional open air markets, although supermarkets, fast-food restaurants and convenience stores are growing in metropolitan areas like Manila and Cebu. Traders and large food processors import most high value agricultural products for redistribution to hotels, restaurants, supermarkets and other retail outlets. Import restrictions are not as great for establishments dependent of the tourist trade and they tend to be the major purchasers of high value goods.

Fresh fruits, canned vegetables and fruits, wine, beef and poultry are among the principal high value imports to the Philippines. Competition comes from a variety of nations, depending on the product. The European Community, China, Taiwan, Australia and New Zealand have all had success in exporting high value products to the Philippines. Promotions for new-to-market products are popular among supermarket managers. Effective product promotion and consumer education is essential to the successful introduction of U.S. food products.

### **Conclusion**

The agricultural markets in Asia are highly erratic in nature. Their dependency on climate creates tremendous surpluses, such as the current wheat surplus, followed by unanticipated shortages, such as the projected shortage of rice in Vietnam. These imbalances affect the ability of each country to trade efficiently and encourage protection of domestic agricultural markets.

The fear of liberalization of agricultural markets is a common element among Asian countries. South Korea's Minister of Agriculture was fired recently in an attempt to appease the highly vocal Korean farmers. Korea is seeking protection from competition in its rice and fruit markets, following Japan's lead in citing national security as justification of its actions. "If we fail to secure food security, that means complete surrender to foreign pressure," says Kim Jong Yong, a director-general of the Ministry of Agriculture. "If we give up that last one, it means the total collapse of our agriculture."<sup>88</sup>

The impact of surpluses and the need to support domestic markets has led to Thailand's current rice dilemma. A program to support rice prices created a surplus of low grade rice that the Thai government is now trying to sell at below market prices. While this strategy was successful in 1989, it appears to be failing. The threat of Thai rice being bought at its below market prices and being resold may necessitate government intervention, either in the form of restrictions of resale or further domestic price support programs. Vietnam has also become a strong competitor in the low grade market at a time when world exports of rice are slowing down.

There is tremendous demand in the developing countries in Asia as well as in the Soviet Union for agricultural equipment and technology. The potato crop in the Soviet Union is rotting in the fields because of a lack of harvesting equipment. The government has sent soldiers into the fields to pick the bumper crop of potatoes in an attempt to avoid a shortage of potatoes, the staple diet of many Russians. China also faces tremendous technological needs. It is counting on its surplus of corn to increase in its exports and to

bring into China the foreign currency earnings it desperately needs in order to continue improving its infrastructure.

Agricultural equipment, biotechnology, bulk commodities and high value food products will remain strong markets for the United States in Asia. Unless there is a deep downturn in the global economy, the demand from fresh fruit, particularly citrus, apples and grapes, will continue to increase. Trade balances, crop production and government programs will determine which sector is likely to be the most promising of the 1990s.

Adaptation to the Asian markets, both in high value products and in technology, will be fundamental to the success of U.S. package food exports. First, American exporters must recognize that the markets of Asia are changing. Who would have anticipated the success of Kentucky Fried Chicken in Beijing or the vast variety of fast food franchises stretching from McDonalds in Tokyo to Haagen Daz Ice Cream in Jakarta? There is, however, a need for direct market contact by would be exporters. Culture is a prime factor and this means that advertising, packaging, and taste must be taken into account if one is going to be successful in penetrating these highly individualistic markets. Furthermore, extended research needs to be done in terms of how goods are purchased, in what quantities, how often, and the distribution channels used. In short, American marketers of food products must take a renewed approach if they are going to be successful in fully penetrating and not just tapping the growing markets in Asia.
