Abstract

This study investigates the strategic behaviour of food industry firms. Its two goals are to:

(i) characterise strategies being employed; and
(ii) identify distinct approaches to information-sharing

Data from an interview-format survey of Danish food industry firms are used to characterise strategy at two levels: 11 “strategic orientations”; each of which is composed of 3-6 of a total 57 “strategic actions”. Principal components were identified and two complementary cluster analysis techniques were used to assemble clusters that are composed of firms either with distinct strategies, or sets of strategies occurring in distinct combinations.

Eight clusters emerge, with reasonable procedural performance. The clusters are distinct in a surprisingly large number of ways, including their strategies for market share, pricing, approach and response to regulation, exports and use of retailers’ own-label brands. Information-sharing strategies are closely linked to both marketing strategy and regulation response/anticipation.

Individual clusters identify distinct sets of behaviour regarding information-sharing up and/or down the value chain, their approach to quality and other aspects of market segmentation, targeting of export markets, and willingness to compete on price. Clusters’ distinct strategies regarding regulation featured anticipation, as opposed to several diverse means of passing on compliance costs: to buyers or to sellers. Such activities were linked to information-sharing strategies in different ways by different clusters.

Danish food industry – a brief introduction

The food industry is a major industrial sector in Denmark. Though the relative share is decreasing over time around 20 per cent of total industrial turnover still comes from the food industry and that places the sector in a remarkable position seen from a global perspective.

The Danish food industry is dominated by two major branches - dairy and meat industry - which accounts for more than 50 per cent of the turnover of the sector.

The development of the industry structure has been very rapid during the latest decades. The number of firms has fallen dramatically and today only few firms have survived. The result has been increasing concentration ratios in almost all groups of the food industries.

The export orientation has been high for many years – almost back to the beginning of the 20th century. In general, about 60-70 per cent of agricultural production is exported. Diversification of export markets and export to far more distinct markets have characterized the development indicating a step further in the globalization process.

Cooperatives play an important part in the Danish food industry. Close to 50 per cent of the turnover in the food industry comes from cooperatives owned by farmers. Vertical integration is a major driver for the existence and success of cooperatives in the sector.

The structure and the development of Danish food industry will to some degree influence the strategies formulated and chosen by the firms. As cooperatives aim at increasing farmers’ production prices or reducing their input prices it is expected this may have an impact on the strategies of cooperatives.

**Data and method**

**Survey**

An interview-based survey of Danish food industry firms was conducted November – December 2005 and March - May 2006. Draft questionnaires were prepared, and repeatedly circulated to 15 organisations with an interest in food industry research and policy, during the period May-October 2005. Six food industry firms made themselves available for testing of the later drafts of the questionnaire, in many cases being the subjects of numerous mock interviews. The comments, criticisms and proposals of both stakeholders and firms were, as far as possible, incorporated into questionnaire and research design.

A team of six students were trained in all aspects of the survey from initial telephone contacts to detail of interview technique and data processing. A commercial database of contact details was purchased, with stratified sampling based on size and sector. Firms with less than five employees, and firms from several commodity sectors, were excluded. This sampling procedure yielded 986 firms, in almost every case being the total number of eligible firms, despite the stratified sample. After eliminating defunct firms, incorrect contact details, subsidiaries of other contacted firms in the sample and those firms not currently active, telephone contacts were made with 444 firms.

The survey procedure yielded 131 valid responses (a 30% response rate on 444 firms). The degree to which the survey is representative of the population of Danish food industry firms cannot be directly estimated, although table 1 below provides an overview. Eleven firms from the sectors “ingredients”, “primary agriculture” and various “services” also appear in the survey dataset. These firms are classified by Statistics Denmark as being one of retailers, processors or wholesalers, but claim to operate at another stage of the chain.

The numbers of firms in the population includes firms with less than 5 employees, defunct firms, subsidiary firms and/or firms otherwise ineligible for the survey. Coverage rates range from the very low (8 unspecialised retail firms out of 3129 in the country) to quite large (3 of 8 poultry processors, 9 of 39 fruit and vegetable processors, and 17 of 61 dairy processing plants (including ice cream manufacturers)). Many of the largest and best-known of Denmark’s food industry firms participated in the survey. Clearly, coverage and representative-ness are greatest amongst processing firms, although sufficient wholesale and retail firms are included to allow some inference to be drawn.
Survey questions regarding strategy

Firms were asked to state their strategy at two “levels” for both 2000 and 2005. The first level was characterised with 11 different “strategic orientations” (table 2):

Table 2. Categories for “strategic orientation”

<th>Brands</th>
<th>Specialisation</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
<td>Employees</td>
<td>Marketing</td>
<td>Market share</td>
<td>Research</td>
</tr>
</tbody>
</table>

Firms were also given the opportunity to respond “other strategic orientation not shown here”, and “this firm has no specific strategic orientation”. Firms could also choose not to respond at all.

For the second level each strategic orientation was sub-divided into 4-7 categories, each corresponding to a specified “strategic action” or an alternative “other”. The strategic actions associated with each strategic orientation are listed in table 3. Firms were asked to classify, again for 2000 and 2005, the strategic actions that they carried out.

Survey results

Almost all firms (93%) claim to have a strategic orientation for “quality” and 84 % for “cost”. The least popular strategic orientation is “research and development” (37% of all firms).

When examined by sector (table 4) few obvious patterns emerge. Notably, a majority of firms in the fruit and vegetables sector claim “research” as a strategic orientation, and rather few poultry firms (33%) claim a strategic focus on “marketing”.

The lowest revenue size group has “quality” as the most popular strategic orientation, and research, market share and information as the least popular (see table 5). In general, the smaller firms are oriented to “quality” and “specialisation” to a greater degree than are larger firms. For the larger firms, “cost” and “price” are the most commonly-claimed strategic orientations. About 60-70% of firms from all size categories claim to have a strategic orientation on “brands”. For small and medium-sized firms, “information” and “market share” are claimed as strategic orientations by a minority or small majority of firms.

When dis-aggregated by stage of the food marketing chain (see table 6), there is surprisingly little pattern to firms’ statements of strategic orientation. Firms at the “service” stage claim to pursue strategies in every category, as do almost all “ingredients” firms (with the notable exception of a strategic orientation on “brands”). The most popular orientations for processing and wholesale firms are quality, costs and price: wholesale firms appear to put greater emphasis on “cost” and “information” than do processing firms. “Research” is again the least popular strategic orientation across all stages of the chain. There appears to be substantial variation across stages of the chain in the emphasis given to strategies concerning “employees”.

A closer examination of the survey results is occasioned by the firms’ responses about their strategic actions: the “second level” referred to above. To best present this data, firms’ responses are categorized. Initial draft versions of the survey questionnaire had invited firms to assign scores or rankings to strategic orientations or strategic actions. However, in test interviews
firms declined to use a Likert scale and simpler versions of it. As a consequence, use or non-use of strategies was recorded by simple “yes” and “no” answers. The two years of data were then combined to generate a record of whether firms had, or had not, applied a nominated strategic orientation (at the first level) or implemented a specific strategic action (at the second level).

The resulting classification is “Always”, “Adopt”, “Drop” and “Never” indicating whether a strategy was pursued in the entire period 2000-2005, adopted or dropped between the two years, or was never followed as a strategy during the period (see table 7). These classifications are used to generate scores for the clustering procedures.

<td>The strategy was employed in neither 2000 nor 2005</td>
</tr>
</tbody>
</table>

Around 15-20% of firms have adopted strategies associated with generation of information with trading partners in the supply chain (figure 1). It is notable that there is a clear difference between the proportion of firms sharing information and the proportion using internal information to satisfy buyer requirements. Surprisingly, only about 35% of firms claim to have emphasised information systems focused on performance measurement, and of this number just 8% have adopted this practice between 2000 and 2005.
Clusters delivered

The cluster analysis yielded 8 clusters (cluster 5 omitted)
1. “Small, buyer oriented, local specialisations”
2. “Small, price followers, high value”
3. “Price discriminators, range of markets, research-oriented”
4. “Large, unspecialised, price discriminators”
6. “Domestic market, high quality, customer loyalty”
7. “All things to all people”
8. “Small, price discriminators, little information exchange”

          | Dairy, unspecialised, unspecialised    | Low-average sales                     |
|         |                     |                                        | High sales per employee               |
|         |                     |                                        | Few new products                      |
|         |                     |                                        | High percentage of sales from retailers’ own-label brands |
|         |                     |                                        | Few employees with university degree  |
In table 8, it is apparent that clusters 1, 2 and 8 comprise the small firms, with the largest being in clusters 3, 4 and 7. Cluster 6’s members have an average size near to the average for the whole dataset. Clusters 3, 4 and 6 include a wide range of sizes of firm. Unspecialised firms are found in all clusters, and indeed there is little evidence of commodity specialisation in any cluster. Food processors dominate clusters 1, 2 and 3, while most clusters feature retail members (only cluster 7 excludes retailers). There is little apparent association between the business form adopted and cluster membership, although 1, 2 and 8 feature private companies and some cooperatives. Notably, no cluster features a strong co-operative dominance.

Table 9 presents the % of firms in each cluster that claim each of the 11 strategic orientations addressed in the survey. In general, most firms claim most strategic orientations, with cluster 7 being an extreme case (almost all firms’ claims to have followed almost all strategic orientations). Amongst strategic orientations, “regulation” and “research” feature very few firms from clusters 2 and 4. Amongst clusters, 2 and 4 show the greatest degree of discrimination. These two clusters appear to have few structural characteristics in common.

The most extreme cases of adoption of strategies between 2000 and 2005 was in “information”-related strategy. Between 10 and 20% of firms adopted information sharing with each of buyers and suppliers in that period. Subsequent investigation showed that few firms shared information in both “directions”. Information sharing in the chain was, in 2005, a more popular strategic action than was the generation of performance-related information for use inside the firm.

The clusters display a range of information-exchange strategies, which mostly relates to marketing activities such as the strategy pursued with buyers and suppliers. However, the current study’s clusters are highly differentiated both by the extent and direction of information exchanges and the apparent purposes to which it is put. Cluster 3 (medium sized firms, highly export-oriented, substantial use of retailers’ own-label brands) defines no clear approach to customer loyalty but shares information both up and down the marketing chain. Cluster 4 (large firms) also serves an array of market types and also shares information with both customers and buyers. Cluster 6 (large firms focused on the domestic market) emphasises information exchange with buyers, but not with suppliers. Clusters 1 and 8, both composed of small firms, have very different information exchange strategies: cluster 8 exchanges little information in the chain.
