Abstract

The Barakat Fruit Farm desires to increase their share of the exportable grape market in Egypt. Unfortunately, the grape cultivars currently cultivated by the farm bear fruit after the early market window to the European Union when prices are high. An analysis of the company, competition, consumer, market channel, and conditions, provides insight into possible solutions to the challenges faced by the farm management. Designed for undergraduate classroom use, this case encourages students to think outside of traditional production techniques to arrive at solutions that are viable from both crop culture and financial standpoints.

IAMA Agribusiness Case 12.2

This case was prepared for class discussion rather than to illustrate either effective or ineffective handling of an agribusiness management situation. The author(s) may have disguised names and other identifying information presented in the case in order to protect confidentiality. IAMA prohibits any form of reproduction, storage or transmittal without its written permission. To order copies or to request permission to reproduce, contact the IAMA Business Office. Interested instructors at educational institutions may request the teaching note by contacting the Business Office of IAMA.

The Company

Owner

Reda Barakat grew up in Cairo, studied agricultural sciences, and worked as a faculty member in the Faculty of Agriculture at Cairo University. Dr. Barakat wanted to use his experience and theoretical knowledge of real-life production agriculture; therefore, he decided to own and manage a fruit farm focusing on the export market. In 1994, he purchased about 1,500 feddan¹ of land in Nobarya along the Cairo-Alex Desert road (Figure 1) to fulfill his vision of establishing his fruit farm. Before cultivation of crops, the desert land needed substantial reclamation and building of infrastructure.

Figure 1: Location of Barakat Fruit Farm

As can be seen in Table 1, Reda Barakat started his business by cultivating the same successful crops as the neighboring fruit farms. He also analyzed the major Egyptian fruit export trends during the 1984 to 1994 period. Major export crops showed a steady increase during this period in production, area harvested and export value (Table 2). Therefore, he decided to start cultivating peaches, grapes, and apricots as potential export crops on about 500 feddan. Other areas of the farm (260 feddans) are used to cultivate a variety of vegetable and cereal crops.

¹Feddan is a local measure of land equal to 4,200 square meters or 1.038 acres

Table 1: Cultivated Areas and Crop Production of the Barakat Fruit Farm

Crop	Variety	Cultivated Area (Feddan)*	Farm Production (Tons)2006	Notes
Apricots	Florida Brins	60	2,442	For export & local market
Grapes	Superior Flame Seedless Thompson Seedless	120	1,105	For export & local market
Peaches	Dessert	60	286	For export & local market
Banana	Maghraby	40	18	Local market
Wheat	Giza 168	100	-	Local market
Vegetables	Various	70	-	Local market
Forage	Alfalfa	50	-	Feedstock for farm animals

* 1,000 feddan are in reclamation

Labor

Skilled managers and laborers are essential if the farm is to operate effectively. Dr. Barakat uses two different kinds of labor to run the farm, contracted and seasonal laborers. The contracted laborers include 1 general farm manager, 3 executive agricultural engineers, and 26 technical assistants. The average salary of the general manager is about 1500 L.E.² per month, while each executive engineer earns about 600 L.E. per month. The technical assistants earn about 400 L.E. per month. The general manager is responsible for selecting crops and cultivars to be produced, designing irrigation systems, planning the IPM pest and disease controls, and assigning tasks to the executive engineers and technical assistants. He is also responsible for purchasing inputs and implementing marketing strategies. The executive managers are responsible for the farm operations including the laborers' productivity and overseeing their management; maintaining and altering the irrigation systems; and defining the volume and application time of pesticides. The technical assistants are primarily responsible for farm infrastructure security and fruit orchard conservation, which includes the application of irrigation water, fertilizer, and pesticides. The technical assistants are also responsible for harvesting the mature produce.

The number of seasonal laborers varies from 40 to 60, based on the amount of work needing to be done. These trained laborers are paid about 25 L.E. per day and are recalled, as needed, through a labor contractor. During harvest season, 15 to 20 seasonal laborers are hired per feddan as the fruit ripens. After harvesting, 10 to 15 seasonal laborers are hired to maintain the fruit orchard by cleaning and burning about one feddan of refuse a day.

² 1 L.E. = 0.174 USD in November 2006 when information was collected for case.

Table 2: Production (tons), harvest area (Ha), and export value (USD \$ 1,000s) of major exportable fruit in Egypt

FAOSTAT - FAO Statistics Division 2007 | 17 January 2007.

Products

Egyptian grape exports have steadily increased in the last few years due to a) improvements in production and market quality (boxes and packaging materials), b) the availability of sea transport, which has reduced transport costs, and c) the European demand deficit. Because of this, the grape production of Barakat Fruit Farm is directed toward the export markets, and the majority of other fruit production is allocated to the local market. The grape cultivation area in Barakat Fruit Farm represents about 24% of the total cultivated area (120 feddan out of 500 feddan). Three late-season grape cultivars, Superior, Flame Seedless, and Thompson Seedless, are cultivated on 40 feddan each. These cultivars vary in production quantity and quality (Table 3).

Table 3: Economic Indicators for Table Grapes Produced on Barakat Fruit Farm

Variety	Cultivated Area (Feddan)	Production (Ton/Feddan)	Export	Local Market
Superior Flame Seedless	40	9 to 11	54%	46%
Thompson Seedless	40	8 to 10	60%	40%
Seedless	40	8 to 9	44%	56%

Estimation Model

Production parameters for attaining quality grapes in Egypt are readily available (Azancot, 2000; Berger, 1998; Tayel et al., 2008). Many small producers of Egyptian grapes utilize less than optimal production practices due to limited access to information. Management at the Barakat Fruit Farm does not have this limitation and opted to maximize harvest quantity and quality by adapting a drip irrigation system to supply water and chemical fertilizer to the vineyard. Barakat Fruit Farm management and laborers are skilled in grape cultivation thereby ensure consistency of product and the ability to change cultural practices as needed to increase crop production or quality. Importantly, the trained laborers live close to the farm, providing an added level of security in the event of unforeseen production issues.

Local Competition

Egyptian producers of table grapes in Minia, Gharbia, Behera, Dakahlia, Giza, Menoufia, and Beni Suef governorates are the main competitors for Nobarya producers (Figure 2). These competitors include large-scale farmers, small-scale farmers and farmer associations, who commonly cultivate early maturing grape cultivars. Southern Egypt grape producers may have some climatic advantages over northern Egyptian grape producers, but are at a disadvantage with transportation and cold chain facilities.

Figure 2: Table grape production by region in Egypt.

Source: Swanson et al. 2004 - MUCIA DATABASE, 2006.

With the exception of the Nobarya area, where late season grapes are cultivated, only a small amount of the grape production from the regional Egyptian competitors mentioned above, as little as 1.4 % (El-Sawalhy et al., 2008), goes to the export market. The second-class and third-class grapes from all regions are shipped to the local market, which negatively affects local area grape prices. For example, the Egyptian table grape production in the 2005 season was about 1,275 million tons. About three percent of this amount was exported abroad, while the rest (97%) was consumed domestically.

International Competition

A window of opportunity for fresh table grapes in the foreign market, especially in the European Union (EU), exists. For a two-month period, the supply of table grapes is reduced in Europe accompanied by an increase in product price, due to scarcity (Figure 3). Egyptian producers and exporters are using this opportunity to their advantage as the grape harvest begins in May and continues until the end of September (for white varieties) or into November (for red varieties). The peak occurs when many competitors halt supply and before other competitors initiate supply. During this time high prices occur.

Source: Central Agency for Public Mobilization and Statistics (2007).

The Egyptian grape market share in the world market is greatly influenced by the time of export, export prices of competitors, and the quality of product being exported (El-Sawalhy et al., 2008). A marketing study tour in the EU examined the export of Egyptian table grapes and found that few competitors appeared between May 15 and July 1. However, several Mediterranean countries also began exporting table grapes to the EU market, including Israel, Jordan, southern Spain and Greece. There are also non-Mediterranean suppliers, primarily Brazil and Mexico, who partially supply table grapes during this time. In addition, grapes imported to the EU from Argentina, Chile, South Africa, India, and Pakistan are gaining an increased market share during this period (Saied, 2001). Even with competition, however, Egyptian grapes represented 3.6%, 3.5 %, and 2.4% of imported grapes during 2004 in the United Kingdom, Italy, and Netherlands markets, respectively (Eurostat, 2007). The opportunity exists for Egypt to increase its market share of table grapes in the EU during this window. El-Sawalhy et al. (2008) reported that Egyptian grape exports may be increased in certain EU markets, but that price is the key factor to effectively competing in the world market.

Consumer

The consumer, specific target markets, types of clients, their purchasing power and their needs will be discussed in this section of the case. The EU market is considered the largest market for importing table grapes from Egypt, especially UK, Netherlands, Italy, Germany, and Belgium (Figure 4).

Figure 4: The Main EU Markets for Egyptian Table Grapes, 2005

Source: Swanson et al. 2004 - MUCIA DATABASE, 2006.

This may be attributed to the more than 379 million people with good incomes (GDP per capita = 23,200 €) and the trend toward a healthy lifestyle that is increasing the demand for fresh fruits and vegetables. The EU also has a limited capacity to produce fresh fruits and vegetables, which creates seasonal shortages (Eurostat, 2007). The EU market is relatively close to Egypt, which results in low

transportation costs. Therefore, the EU is a promising market for Egyptian grapes. Finally, there are also the emerging markets of Eastern Europe countries like Poland and Hungary that observe quality standards like EurepGAP but are less stringent than Western Europe in this aspect. After careful consideration of all crops produced on the Barakat Fruit Farm, the management decided that grapes were the most likely crop that could be produced for export.

Market Channels

Egyptian market chains for horticultural crops have strengths and weaknesses (Alaa, 2004). Market channels, specifically the distribution system to local and export markets, the market organization (wholesale markets and middlemen), and the market share for Egyptian table grapes can be divided into the domestic market (97%) and the overseas markets (3%). The domestic market can be subdivided into retail, institutional, and processing, while the overseas fresh markets can be again subdivided into conventional and organic. Various factors influence the competitive advantages available to Egyptian products traveling through the market channel and must be assessed when estimating potential profitability of a product (Alaa, 2004).

When estimating the potential profitability of table grapes, the margins charged by different intermediaries in the export industries are influenced by many different factors. These include the type of grape produced (cultivar, season, and quality), the current and expected future harvest situation, the level of demand, and the price trend. All of these factors make it extremely difficult to provide information on typical margins in the trade. For the purposes of this case, the following numbers presented in Table 5 are very rough guidelines on the mark-up added to the buying price by each type of middlemen and exporter. For many horticultural products, middlemen and exporters pool product from several farms until a suitable volume is available for exportation (Alaa, 2002). Barakat Fruit Farm, like most small farms, does not have the international connections or the product volume to market their products directly to international clients and must rely on middlemen and exporters for the distribution of product. Interviews of exporters and farmers also revealed that a margin of about 25% to 40% is added to the prices that exporters take from farmers. Farmer estimates of price increases in grapes agree with those on other horticultural crops (IFAD 2008). The level of these increases for any given crop is based on cultivar, season, and quality.

Table 5 illustrates the per ton value of Egyptian grapes exported during 2005 to the European Union, Gulf States, and Asia. The values presented exclude packaging at the farm level and assume a 5%, 10%, and 20% loss rate at the wholesale, retail, and export levels, respectively. Packing, grading, and shipping costs are included at the retail and export level.

Table 5: Per Ton Value of Egyptian Grapes Exported during 2005

Costs and Prices	Egyptian Pounds L.E.	U.S. \$
Production Costs	501	86
Farm Price	1,200	207
Net Margin for Farmer	699	121
Farm Price + Transportation/Loading (Wholesale Cost)	1,270	219
Wholesale Revenue (Wholesale Price)	1,500	259
Net Margin/Wholesale	230	40
Wholesale Price + Loading (Retail Cost)	1,625	280
Retail Revenue (Retail Price)	2,000	345
Net Margin/Retail	375	65
Wholesale Price + Loading/Shipping (Export Cost)	5,889	1,015
Export Revenue (Export Price)	9,280	1,600
Net Margin/ Export	3,391	585

Conditions

The Teaching Notes for this case examine the challenges facing the farm manager. The farm produces cultivars of grapes that mature at the end of June. This is an issue as the farm's exportable grape product misses the most of the EU's early market, i.e., the mid-May to the end-of-June window. Grape exportation from Egypt to the EU plummets from late June to mid-July. The Barakat Fruit Farm management believes there are several options that can be pursued to increase the percentage of exportable grapes produced on the farm for this early market window. The owner of the Barakat Fruit Farm is considering three possible solutions to the company's current situation:

1. Replace the existing late season cultivars in the grape vineyard with early season cultivars,
2. Adjust applied agricultural practices and farm structure to produce high quality grapes for the early market using the existing vineyards, or
3. Cover the existing grape vineyard with plastic sheets (thiran) to hasten crop maturation.

Acknowledgements

The authors wish to thank the management of the Barakat Fruit Farm, Dr. Reda Barakat, and Dr. Samy Mohamed, MUCIA-AERI Linkage Project Chief of Party, for their collaboration in the development of this case. We also thank our colleagues from the Faculties of Agriculture at Cairo University, Fayoum University, Minia University, Assiut University, and the University of Florida for their repeated evaluations of the case and for being the initial “students” for the pilot trial of the case. We thank the participants of the “Capstone Course and Case Studies: Linking the classroom and value chain” workshop held in Ein Sokhna, Egypt, August 2007 for providing a realistic classroom testing of the case. Finally, we would like to thank the MUCIA-AERI Linkage Project office personnel for their logistical support and coordination of the farm site visits needed for gathering case information.
