Measures of Trends in Farm Size Tell Differing Stories

The total amount of land used for farming has been relatively stable for several decades, but this stability masks significant changes in the structure of agriculture. Since 1982, the number of large farms and very small farms has increased, while the number of small to midsized farms has declined. The changing size distribution of farms makes it difficult to capture the trends in a simple measure, such as the average or median farm size. A size measure that reflects both the increasing concentration of production on large farms and the growth in the number of small farms can provide insight into the structural changes occurring in U.S. agriculture.

Farmland Has Become Concentrated on Larger Farms

In recent decades, agricultural land has become concentrated on larger operations—the number of farms with more than 1,000 acres increased by 14 percent between 1982 and 2002. Farms with 50-1,000 acres declined by about 17 percent, while the number of farms with fewer than 50 acres increased by roughly the same percentage.

Small farms, however, account for only a very small share of total farmland. Farms with fewer than 50 acres operated less than 2 percent of all farmland in 2002, while farms with more than 1,000 acres operated two-thirds of all farmland.

More large farms, more very small farms, fewer in the middle

Most farmland is in large farming operations, 2002

Share of all farmland (percent)
New Measure Tells a Different Story

This simple three-farm example is similar to what has actually occurred in U.S. agriculture, and the three size measures—average, median, and acre-weighted median—suggest different trends over time. Because the total amount of farmland and the number of farms have remained stable since 1982, average farm size has also remained stable. Average farm size was 441 acres in 2002, and ranged between 430 and 480 acres in the previous 20-year period. In contrast, the median farm size in 2002 of 95 acres represents a 20-percent decrease over the period, largely reflecting the growing number of very small farms.

On the other hand, the acre-weighted median increased by about 35 percent since 1982, reflecting continued shifts of land to bigger operations. In 2002, the acre-weighted median was 2,190 acres—half of all farmland was on farms that were larger than that size.

Measures of farm size show different trends
