Testing capital structure theories for agricultural cooperatives: trade-off, pecking order, and signaling theories.

Yuxi Lance Cheng, Ani Katchova

The Ohio State University

November 1, 2017

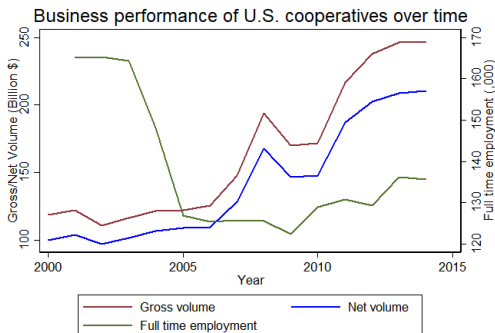

NCERA-210 Cooperatives Annual Meeting

WHY CAPITAL STRUCTURE

- ▶ The capital structure for a business is one of its most important choices
- ▶ A careful balance between equity and debt is also necessary for businesses to efficiently achieve profit maximization, and boost growth
- ▶ The pursuit of such efficiency is mirrored at the ag retail level for ag cooperatives
- ▶ Research question for this study: how do ag cooperatives use financing to determine their capital structure and what theories do they follow?

OVERVIEW OF U.S. AG COOPERATIVES

- ▶ The current agricultural downturn has changed the landscape of the agricultural cooperatives industry.
 - ▶ Recent downturn for agricultural cooperatives resulted in decreased volumes & employment since 2013

USDA Rural Development

- ▶ Cooperatives are facing pressures both upstream and downstream through the supply chain.

TRADE-OFF THEORY

- ▶ Given constant amount of assets and investments, firm's optimal debt ratio is determined by a trade-off of the benefits and costs of borrowing
- ▶ Benefits: Tax shields – tax deductibility of interest payments, less free cash flow problem
- ▶ Costs: Increased financial stress, potential bankruptcy costs, agency conflicts between lenders and borrowers
- ▶ Our study will test whether ag cooperative follow the trade-off theory - when short or long term debt stock is above optimal ratio when reduce debt and vice versa.

PECKING ORDER THEORY

- ▶ Start with Myers (1984) Myers & Majluf (1984)
- ▶ Empirical evidence for the pecking order theory is not consistent with a financial policy that is determined by trade-off
- ▶ 1. Firms prefer internal financing to external financing (cash flow before debt or equity financing)
2. Cash flow obtained in periods of financial surpluses are directed to finance short-term financial investments or to reduce debt
3. When there is financial deficit, firms will seek external finance in the preference "pecking" order of debt, securities, equity issue
4. Our study will test the pecking order theory of ag cooperatives following pecking order of cash flow first, debt second, and then equity.

SIGNALING THEORY

- ▶ Signaling is crucial in the lender-borrower relationship and will directly influence the cost and availability of debt to agricultural borrowers
- ▶ A credible signal can distinguish a high-quality firm from a low quality firm, if the latter one is unable to mimic the signal or finds it too costly to do so
- ▶ Potential signals could include: debt(Ross, 1977), owner fractional holding (Leland & Pyle, 1977), cash flow, current share price (Downes & Heknel, 1982)
- ▶ We test whether ag cooperatives use two indicators:
1.Cash flow, 2. Profitability (return on assets) to "signal" good performance to lenders.

THEORETICAL HYPOTHESES

- ▶ Trade-off theory:
 - ▶ Hypothesis 1: **Negative** relationship between change in short/long term debt and lagged stock value of short/long term debt
 - ▶ Hypothesis 2: **Negative** simultaneous relationship between changes in short term and long term debt
- ▶ Pecking order theory
 - ▶ Hypothesis 3: **Negative** contemporaneous relationships between cash flow and changes in short/long-term debt
 - ▶ Hypothesis 4: **Negative** relationship between investment and lagged changes in short/long-term debt
- ▶ Signaling theory
 - ▶ Hypothesis 5: **Positive** relationships : 1. between the change in short/long term debt and lagged return on assets; and 2. between the changes in short/long term debt and cash flow

DATA

- ▶ CoBank data
- ▶ CoBank provides loans and financial services to agricultural cooperatives, agribusinesses and other farm credit associations
- ▶ Financial statement information for about 700 cooperatives over a five-year horizon

REPRESENTATIVENESS OF COBANK DATA

TABLE1. Comparing CoBank dataset with USDA

	2012		2013		2014		2015	
	USDA	CoBank	USDA	CoBank	USDA	CoBank	USDA	CoBank
Average total assets	37.28	40.5	37.77	38.7	41.35	42.1	43.10	41.77
Average short-term liability	11.01	20.3	15.83	16.6	16.87	15.8	16.33	15.66
Average long-term liability	12.78	3.64	6.09	3.46	6.63	3.93	6.98	3.91
Average equity	13.48	15.5	15.84	17.6	17.85	19.5	19.79	20.96
Average allocated equity	3.12	6.03	9.86	6.48	10.67	7.76	11.83	7.68
Average retained earnings	1.74	9.52	5.99	10.8	7.18	13.2	7.96	13.00
Number of cooperatives	2236	683	2186	688	2106	694	2047	678

CONCLUSION

- ▶ This study has conceptualized and tested joint effects of the trade-off, pecking order, and signaling theories for ag cooperatives capital structure
- ▶ Regression results from the aggregate estimation show that
 - ▶ The trade-off theory works well. Hypothesis 1 is fully supported, and Hypothesis 2 is partially supported.
 - ▶ The pecking order theory: Hypotheses 3 & 4 are supported for the relationship between cash flow and short-term debts, but they are not supported for long-term debt. This result might indicate that cooperatives are facing financial constraints with long-term borrowing.
 - ▶ Signaling theory: Cooperatives tend to use previous cash flow as signaling to expand their debt, and less attention is placed on profitability as a signal.

CONCLUSION

- ▶ Results by different debt sources reveal several trends:
 - ▶ Cooperatives adjust their CoBank debt on both CoBank/Non-CoBank debt, while the adjustment of Non-CoBank debt is only based on Non-CoBank debt.
 - ▶ Cash flow is used as signal by CoBank in short-term lending, while other agencies use cash flow to determine long-term lending.

A FEW REMARKS

- ▶ Sources of variation within different debt group haven't been investigated.
- ▶ Differences among other categorizations still need to be estimated.
- ▶ Other signals might exist as well.

Thank You!
