Conservation Policy: Realistic Expectations from the Next Farm Bill

Presentation at USDA Agricultural Outlook Forum 2002, Washington, D.C.

Thomas L. Dobbs
Professor of Agricultural Economics
South Dakota State University
Whose expectations?

- Mainstream Agriculture (MA) pragmatists’ vision: Continuation of present trends involving ever-larger farms, specialized crop production, and large-scale confined animal feeding more or less inevitable.
  - high levels of commodity production and exports are central goals
  - recognition of reality of more stringent environmental constraints
Or a different vision?

• **Sustainable Agriculture (SA) advocates’ vision:** That continuation of present trends not necessarily inevitable if a broad range of public policies radically altered. Advocate greater emphases on:
  – economic viability of ‘moderate-sized’ family farms
  – broad range of environmental objectives
  – rural development
Farm bill conservation expectations of MA advocates

• Continuation of policies that compensate farmers for most costs of meeting environmental objectives (the ‘provider gets’ principle)

• Allow large scale livestock operations to receive cost-share

• Environmental policies that enable, rather than inhibit, intensive agriculture
MA advocates’ expectations, cont.

• Continuation of generous price and income support (and risk reduction) policies as part of the *quid pro quo* for meeting ‘baseline’ environmental conditions

• Continued crop planting flexibility, with any ‘supply control’ to come from environmental set-asides (CRP)
Farm bill conservation (‘agri-environmental’) expectations of SA advocates

• Priority to moderate-sized farms, both as a ‘Jeffersonian’ end in itself and as a means of promoting environmental stewardship

• Emphasize ‘polluter pays’ principle for controlling negative externalities from large-scale livestock operations
SA advocates’ expectations, cont.

• Utilize stewardship payments to foster provision of positive environmental externalities and public goods
• Complete the ‘decoupling’ of income supports from commodity production decisions
• Shift substantial portions of public funds from price & income supports to stewardship programs (emphasizing ‘working lands’)

Realistic expectations:

MA provisions

- Major price & income supports
- EQIP more friendly to large-scale farms than at present

SA provisions

- Conservation Security Program
- Expansions in various conserv programs (e.g., WHIP, Farmland Protection)
