Conclusion	17

INTRODUCTION

This report summarizes 1972 farm business records by type of farming for 387 northern Minnesota farmers. Farm records were supplied by area vocational-technical schools at Duluth and Thief River Falls. All of the farms are located in the areas east of the Red River Valley. Fergus Falls, Staples and Pine City are on the southern edge of the territory covered.

The purpose of this publication is to present specific information concerning costs and returns from actual farming operations by types of farming, for use by farmers and individuals working with farmers. Information of this nature assists in determining the most profitable types of farming and provides information for farm planning.

* Agricultural Economics, Agricultural Education, and Agricultural Economics, respectively.

Records were obtained from three types of farming for this report (table 1). Farms were classified according to the proportion of cash income received from the various livestock enterprises and from the sale of crops.

The following classifications were used in this report:

1. Specialized farms - 80 percent or more of the cash income was from one enterprise or source.
2. Two enterprise farms - 80 percent of the income was from two enterprises, with a minimum of 20 percent from the smaller of the two.

Specialized dairy farms are further divided into four categories based on the average number of dairy cows maintained.

Table 1. Number of Farms by Type

Type	Number
Dairy, under 25 cows	88
Dairy, 25-34 cows	107
Dairy, 35-44 cows	37
Dairy, 45 cows and over	41
Dairy and cash crops	68
Beef breeding and cash crops	<u>46</u>
Total	387

Records included are for only one year. Farm earnings in 1972 were somewhat higher than in 1971.¹ Differences in climatic conditions as well as variations in general price levels are two important factors that cause farm income to vary widely from year to year and among types of farms.

1. For a comparison with 1971, see Nodland, Truman, Edgar Persons and Janet Otis, "1971 Farm Business Summary by Type of Farming for Northern Minnesota," University of Minnesota Department of Agricultural and Applied Economics Economic Information Report R72-5. August 1972.

CAPITAL MANAGED AND EARNINGS

The average value of capital used per farm for the various types of farming is shown in table 2. These data represent values as reported by farmers in their farm business records and deviate somewhat from current market values for assets with a long useful life, such as real estate. Real estate improvements are valued at cost and depreciated on the basis of estimated life. These book values tend to be below present market values because of changes in the price level. Also, land is valued at cost and has not been corrected for price inflation or for the increase in real value which has occurred since many of the farms were purchased. Thus, the value of land depends to a certain extent on date of purchase. Capital managed also includes the values of any assets furnished by landlords.

The data in table 3 show total and per acre investment in real estate based on "book values." Average per acre real estate values varied from \$85 per acre on the beef breeding herd-cash crop farms to \$125 per acre on large dairy farms. This compares with sales prices for 1972 as reported by Mandale and Raup¹ of \$105 per acre for northwestern Minnesota (including the Red River Valley) and \$77 for northeastern Minnesota.

Capital managed per farm varied widely between types of farming included in this study, in part because of differences in soils and climate. Ottertail and Todd counties, for example, have a rather large acreage in corn for grain. Only occasional fields of corn for grain can be found in the extreme northern counties.

21. Total capital	\$ 40987	\$ 61154	\$ 86124	\$ 133051	\$ 108605	\$ 103472

* Not including farm dwelling.

Other factors contributing to the wide variation in capital managed are number of acres per farm, investment in livestock, and the buildings and equipment associated with each type of farm. Types of farming which can be classified as extensive require large amounts of capital. In this study, where cash crops are

Table 3. Average Investment in Real Estate, by Type of Farming, 1972

Average investment per acre	91	111	97	125	118	85

major enterprises, large amounts of capital are used. More intensive farms, such as those with dairy cattle, tend to have smaller investments in capital.

Earnings are presented on a cash basis in table 4. In order to make all farms comparable, receipts and expenses of landlords are included. "Labor earnings" is the amount that would be left as a salary to the farm operator if he paid hired man's wages for the labor of other members of the family and six percent interest on capital managed.

Increases in farm capital are reported as a receipt and decreases in farm capital are reported as an expense in table 4. Increases or decreases are the differences in the average farm capital between January 1, 1972 and December 31, 1972, as shown in table 2. This summarizes in one figure the net effect of the following changes:

1. Products produced but not sold during the year, so they are on the end of the year inventory.
2. Products that were produced during the previous year or years (on hand at the beginning of year) and sold this year.
3. Products bought but not fully used up during the year, such as fertilizer, depreciable assets, etc.

43. Labor earnings	\$ 3330	\$ 6614	\$ 9062	\$ 12985	\$ 8538	\$ 7191
44. Net cash income	\$ 1177	\$ 5224	\$ 5092	\$ 7730	\$ 8626	\$ 4356
(line 11 - line 37)						

* Includes receipts from diverted acre payments.

4. Products sold that were previously purchased, such as feeder pigs and feeder cattle.
5. Casualty losses.

More than 50 percent of each dollar of sales is required to pay cash operating expenses (table 5). Purchased feeds were an important item on the dairy farms. Capital expenditures showed more variation. The amount remaining above all purchases, 23 percent in the case of the dairy and cash crop farms and only 8 percent in the case of small dairy farms, is left for living expenses, interest on money borrowed, debt retirement, and other savings.

Table 5. Purchases per \$100 of Total Sales, by Type of Farming, 1972*

Item	Dairy, under 25 cows	Dairy, 25-34 cows	Dairy, 35-44 cows	Dairy, 45 cows & over	Dairy, cash crops	Beef br., cash crops

* Includes diverted acre payment.

** Includes wages paid and value of board to hired labor, unpaid family labor and part of the payment for custom work hired.

The data in table 6 report earnings on an enterprise basis. On the enterprise basis, the value of livestock and livestock products produced includes the difference between sales and purchases of livestock, sale of products, value of livestock and products used in the home, changes in inventories, and an accounting of transfers between enterprises. The resulting figure represents value of livestock and livestock products added by the enterprise. Costs of operating each service enterprise

(auto and trucks, tractors and crop machinery, etc.) are calculated in a similar manner. Credit is given to crops for feed raised on the farm and consumed by livestock. Thus, while earnings statements on an enterprise basis do not show purchases and sales, such a statement more truly shows the value produced for the productive enterprises and the expenses for each of the service enterprises.¹

Crops are a major source of income on all farms when credit is given to crops for feed raised on the farm and consumed by livestock (table 7). Even on the highly specialized dairy farms, approximately 30 percent of the income is from crops. The proportion of farm income from livestock, crops and miscellaneous sources is based on receipts and net increases, as shown in table 6. Return over feed is the amount of income added by livestock and the return to crops represents the value of crops produced during the year.

Table 7. Proportion of Farm Income from Livestock, Crops, and Miscellaneous Sources, by Type of Farming, 1972

Item	Dairy, under 25 cows	Dairy, 25-34 cows	Dairy, 35-44 cows	Dairy, 45 cows & over	Dairy, cash crops	Beef br., cash crops

Total	100.0	100.0	100.0	100.0	100.0	100.0

Rate earned on capital managed is increasingly becoming a factor to consider, particularly when the contribution of capital managed to earnings is greater than the value of the operator's labor. Small dairy farms received a modest return to labor and no return on capital. Large dairy farms, on the other hand, yielded a return to capital managed of 10.7 percent and \$7000 return to the farm operator. (See table 8.)

1. For the method of calculation, see Nodland, Truman R., "Know Your Farm Business, University of Minnesota Agricultural Extension Pamphlet 138, Revised 1971.

LAND USE AND CROP YIELDS

Specialized dairy farms have a large proportion of land in pasture, hay, and silage crops (table 9). Small grains (oats, barley, and wheat) are the predominant small grains. Some corn for grain and soybeans are raised on farms in the southern portion of the area.

Average crop yields are shown in table 10. Variations in average yields were large and, in part, reflect differences in soils and climate. Small dairy farms had lower yields than the other groups.

Table 9. Distribution of Acres in Farm, by Type of Farming, 1972

Item	Dairy, under 25 cows	Dairy, 25-34 cows	Dairy, 35-44 cows	Dairy, 45 cows & over	Dairy, cash crops	Beef br., cash crops

RETURN FROM LIVESTOCK

Feed costs, returns and some related factors are shown for dairy cattle in tables 11 through 13. Home grown feeds have been charged to livestock at current market prices during the year. Purchased feeds were charged at cost. The number of head represents the average number on hand at the beginning of each month.

As shown in table 11, average return over feed per cow varied from \$286 for small herds to \$352 for large herds. The large dairy herds had the highest production per cow and the highest price received per 100 pounds of milk sold. They also had the highest total feed costs per cow. The larger herds had a slight price advantage, selling milk from 7 to 21 cents more per hundred pounds than the smallest herds.

The return for \$100 of feed ranged from \$225 to \$246. Feed is the largest single item of cost for all classes of livestock and, in the case of dairy cattle, makes up about 50 percent of the total cost. Thus, on the average, a return of about \$200 for each \$100 of feed is necessary in order to break even, with

average equipment, buildings, and labor. The same kind of analysis can be used with feed cost per 100 pounds of milk produced. The average producer will need to secure a price which is twice the cost of feed per unit of product produced in order to cover all costs, including modest amounts for labor.

Feed costs and returns from other dairy cattle are shown in table 12. These are mostly replacements for the milking herd. Return over feed cost per head and return for \$100 of feed are not related to size of herd as was true for dairy cows, as shown in the previous table. The information in table 13 shows feed costs and returns from the entire dairy herd on a per cow basis. The information presented in this table is especially valuable for planning a dairy operation or for expanding an existing herd, since it includes replacement stock. A typical dairy herd averages about 1.3 head of young stock per cow.

Feed costs and returns from beef cows are shown in table 14. The average return over feed cost per cow or \$138.46 and return for \$100 of feed of \$248 received in 1972 is much higher than one normally expects from a beef cow operation. The return for \$100 of feed is approximately the same as that received from dairy cattle. Costs of shelter, equipment and labor, however, are considerably greater for dairy cattle than for beef cow herds. The relative profitability of beef cows in 1972 is largely a matter of favorable prices for beef cattle.

Table 11. Factors of Costs and Returns from Dairy Cows, by Type of Farming, 1972

Item	Dairy, under 25 cows	Dairy, 25-34 cows	Dairy, 35-44 cows	Dairy, 45 cows & over	Dairy, cash crops

Percent death loss	3.7
Miscellaneous costs per cow	\$4.55

* Includes sale of cull cows as well as young stock.

CONCLUSION

A summary of earnings, resources used, size of business, and expenses is presented in table 15. Small dairy farms showed the lowest earnings. They had only \$5643 available to pay for the operator's labor and capital managed. Large dairy farms yielded a return large enough to provide \$7000 for labor performed by the operator and yield 10.7 percent return on the "book value" of capital managed.

Farms which have cash crops as a major enterprise generally use large amounts of capital and involve large acreages. This is an extensive enterprise and is best suited where labor is scarce as compared to land and capital. Dairying tends to be located on relatively small farms where there is non-tillable land and where it is desirable, because of erosion and other factors, to include a considerable amount of hay and pasture in the rotation. Dairying is an intensive enterprise and is adapted to situations where labor is plentiful in comparison to land.

Dairy farms tend to have had less capital invested per worker than did the other types of farms included in this study. Most of the farm classifications had 1.5 to 2.0 workers. Small dairy farms had only 1.4 workers and large dairy farms had an average of 2.1 workers.

In terms of work units, large dairy farms had the largest business, with 662 productive man work units. Small dairy farms and the beef cow-cash crop farms had relatively few work units in total and per worker. Work units are defined as the average accomplishment of a farm worker in a ten hour day, working on crops and productive livestock at average efficiency, or ten hours off-the-farm work for pay.

It is important to bear in mind that the records included in this report are for only one year. Similar data for a different year would show

variations in the data presented. Variations between years, in the main, are caused by differences in climatic conditions and general price levels-- factors which the individual farmer cannot control. Furthermore, price levels do not rise or fall in unison. Some prices may rise while others are falling, or some may change faster than others. For these reasons, the relative earning levels of the various types of farms may change from year to year.
