Technical Compendium: Descriptive Agricultural Statistics and Analysis for Zambia in Support of the USAID Mission's Feed the Future Strategic Review

by

Nicholas J. Sitko, Antony Chapoto, Steven Kabwe, Solomon Tembo, Munguzwe Hichaambwa, Rebecca Lubinda, Harrison Chiwawa, Mebelo Mataa, Simon Heck, and Dorothy Nthani

April 2011

Nicholas Sitko is research fellow at the Food Security Research Project, Lusaka. Antony Chapoto is research coordinator at the Food Security Research Project. Steven Kabwe, Solomon Tembo, and Munguzwe Hichaambwa are research associates at the Food Security Research Project. Rebecca Lubinda is lecturer at the University of Zambia, Department of Agricultural Economics and Extension Education. Harrison Chiwawa is director of Vet-Crop Farming Services, Zambia. Mebelo Mataa is a horticulturalist at the University of Zambia, Department of Crop Sciences. Simon Heck is senior policy advisor and country manager for the World Fish Center, Zambia. Dorothy Nthani is lecturer at the Natural Resources Development College, Lusaka.

ACKNOWLEDGMENTS

The Food Security Research Project is a collaborative program of research, outreach, and local capacity building, between the Agricultural Consultative Forum, the Ministry of Agriculture and Cooperatives, and Michigan State University's Department of Agricultural Economics.

This technical compendium was compiled with support from researchers at the University of Zambia (UNZA) and the Natural Resources Development College.

We wish to acknowledge the financial and substantive support of the Swedish International Development Agency (SIDA) and the United States Agency for International Development (USAID) in Lusaka. Research support from the Global Bureau, Office of Agriculture and Food Security, and the Africa Bureau, Office of Sustainable Development at USAID/Washington also made it possible for MSU researchers to contribute to this work. The authors also wish to thank Patricia Johannes for her assistance in editing and formatting this document.

Any views expressed or remaining errors are solely the responsibility of the authors.

Comments and questions should be directed to the Food Security Research Project Director, 26A Middleway, kabulonga, Lusaka: tel +260 (21)1 234539; fax +260 (21)1 234559; email: kabaghec@msu.edu

FOOD SECURITY RESEARCH PROJECT TEAM MEMBERS

The Zambia Food Security Research Project (FSRP) field research team is comprised of Chance Kabaghe, Antony Chapoto, T.S. Jayne, William Burke, Munguzwe Hichaambwa, Solomon Tembo, Stephen Kabwe, Auckland Kuteya, Nicholas Sitko, Mary Lumumbu, and Arthur Shipekesa. MSU-based researchers in the Food Security Research Project are Steve Haggblade, Nicole Mason, James Shaffer, Margaret Beaver, and David Tschirley.

EXECUTIVE SUMMARY

Background

This technical compendium was developed to serve two interrelated purposes: 1. To assist in the development of USAID Zambia's Feed the Future (FtF) strategy by providing a broad empirical analysis of the current conditions and historical trends shaping Zambia's agricultural and food sector; and 2. To serve as a technical reference for organizations tasked with designing and implementing programs associated with FtF.

Problem Statement

Population growth, rapid urbanization, and stagnant agricultural production are contributing to an emerging structural deficit of food crops in the southern Africa region. Finding ways of effectively coping with this emerging food deficit is critical for fostering economic growth, reducing poverty, and enhancing food/nutrition security for the people of southern Africa. Addressing this challenge requires placing agriculture- and the associated processes of production, trade, processing, and consumption - at the forefront of any economic development strategy for the region.

Zambia is in a unique position to not only leverage agriculture as an engine for poverty reduction and improved nutrition, but to become the *breadbasket* of southern Africa. Relative to other countries in the region Zambia has an abundance of fertile land, water, and a generally favorable climate for agricultural production. Moreover, Zambia has a large and rapidly growing urban population, which creates opportunities for rural-urban development synergies that may not exist in other countries.

Despite these unique endowments, agricultural growth in Zambia remains stagnant, poverty rates in rural Zambia remain stubbornly high, at 80% of the population, and incidences of stunting, malnutrition, and wasting continue to disproportionately affect rural Zambians. While rural Zambians are generally worse off in terms of poverty and malnutrition than their urban counterparts, addressing food and income inequalities in urban areas are of equal importance for fostering economic growth, poverty reduction, and improving the nutritional status of Zambians.

USAID Zambia's FtF strategy is guided by the assumption that fostering improvements in the production and marketing of the food crops that are of the greatest importance to small-scale farmers and the urban poor provides the best vehicle for stimulating economic growth and poverty reduction in Zambia. Yet, supporting small-scale farmers to earn more from agriculture and for urban consumers pay less for their food does not immediately translate into improvements in the nutritional status of Zambians. Rather, these changes must be seen as a precondition for effective nutrition related interventions in health-care and education.

Data

The data presented in this technical compendium is derived from a variety of sources. Data on household production comes primarily from two nationally representative surveys: 1. the Crop Forecast Survey (CFS) conducted annually by the Ministry of Agriculture and Cooperatives (MACO); and 2. the Central Statistics Office (CSO) and the Supplemental

Survey (SS) conducted periodically by the Food Security Research Project (FSRP). Household livelihood data is primarily gathered from the supplemental surveys, which is a nationally representative panel survey of households in Zambia. Nutritional and health data comes from the Living Conditions Monitoring Survey (LCMS) carried out by CSO. Other important data sources include FAOSTAT, the CSO post-harvest survey (PHS), and the FSRP Urban Consumption Survey.

Key Findings

- Rapid population growth and urbanization are contributing to increased pressure on Zambia's food, health care, sanitation, and education systems. This in turn poses a growing threat to levels of food insecurity, malnutrition, and poverty, particularly for the poorest and most vulnerable segments of the population.
- While the overall poverty rate in Zambia has declined over time, poverty rates in rural Zambia remain stubbornly high, with 80% of the rural population living in poverty.
- Despite its rich agricultural resources, Zambia has continued to experience chronic food and nutrition security problems. Stunting rates in Zambia stand at 45%, with 21% being severe. Stunting remains the most common nutritional disorder affecting under five years children in Zambia, above the Sub-Saharan Africa average of 42%; and (ZDHS 2007).
- Agriculture in Zambia supports the livelihoods of over 70% of the population. 78% of women in Zambia are engaged in agriculture, compared with 69% of men.
- Zambia's economy has grown steadily in real terms since 2001. However the percent contribution of the agricultural sector to GDP has declined from 16% in 2001 to 12.6% in 2009.
- Cropping characteristics: Small-scale farming systems in Zambia are overwhelmingly dominated by a single crop: Maize. In 2009/10, 81.72% of all smallholders grew maize. Cassava cultivation, the second most important staple food crop, is geographic confined to the north and northwestern parts of Zambia. Groundnuts, the second most widely cultivated crop in Zambia and important source of protein in Zambian diets, are frequently intercropped with maize. In Zambia, groundnuts are often considered a *women's crop* due to their importance for home consumption.
- Yields: Yields for all crops in Zambia are well below global averages. However, while national yields are low, the top 10% of smallholders achieve yields that are one to nearly four metric tons (mt) more than average depending on the crop. This suggests the potential for yield improvements in Zambia.
- Input use: While input use has trended upward since 2001, 60% of Zambia farmers still do not use fertilizer on their fields, while more than 60% do not use hybrid maize seeds.
- Land: Despite a relatively low population density, growth in the number of rural households contributes to increasing land fragmentation and shrinking land size holding in Zambia. While the mean land size holding in Zambia is 3.27 hectares, a quarter of the rural population controls on average barely one hectare of land.
- Market Position: In Zambia, 2% of small-medium scale farmers produce roughly 50% of the country's total maize supply. A further 19% produce the other 50% of surplus maize in Zambia. Despite the high prevalence of maize cultivation in rural Zambia, 36% of rural households are in fact net buyers of maize (Figure 22). These farmers tend to control smaller farm sizes and tend to be located in more marginal agro-ecological zones.

- Caloric intake among Zambians is overwhelmingly dominated by a single food crop, maize. According to FAOStat maize accounts for 57% of Zambians' daily caloric consumption.
- Government spending on agriculture is just under 10% of the total government budget, which is approaching the spending goal agreed upon under the 2003 Maputo Declaration. However, procurement and distribution of maize through FRA and input subsidies through FSP/FISP account for over 43% of the total agricultural budget.

I. STATEMENT OF THE PROBLEM

Population growth, rapid urbanization, and stagnant agricultural production are contributing to an emerging structural deficit of food crops in the Southern Africa region. Finding ways of effectively coping with this emerging food deficit is critical for fostering economic growth, reducing poverty, and enhancing food/nutrition security for the people of Southern Africa. Addressing this challenge requires placing agriculture- and the associated processes of production, trade, processing, and consumption - at the forefront of any economic development strategy for the region.

Zambia is in a unique position to not only leverage agriculture as an engine for poverty reduction and improved nutrition, but to become the *breadbasket* of southern Africa. Relative to other countries in the region Zambia has an abundance of fertile land, water, and a generally favorable climate for agricultural production. Moreover, Zambia has a large and rapidly growing urban population, which creates opportunities for rural-urban development synergies that may not exist in other countries.

Despite these unique endowments, agricultural growth in Zambia remains stagnant, poverty rates in rural Zambia remain stubbornly high, at 80% of the population, and incidences of stunting, malnutrition, and wasting continue to disproportionately affect rural Zambians. While rural Zambians are generally worse off in terms of poverty and malnutrition than their urban counterparts, addressing food and income inequalities in urban areas are of equal importance for fostering economic growth, poverty reduction, and improving the nutritional status of Zambians.

This strategic review is guided by the assumption that fostering improvements in the production and marketing of the food crops that are of the greatest importance to small-scale farmers and the urban poor provides the best vehicle for stimulating economic growth and poverty reduction in Zambia. Yet, supporting small-scale farmers to earn more from agriculture and for urban consumers pay less for their food does not immediately translate into improvements in the nutritional status of Zambians. Rather, these changes must be seen as a precondition for effective nutrition related interventions in health-care and education.

II. CONTEXT

2.1. Population

Rapid population growth and urbanization are contributing to increased pressure on Zambia's food, health care, sanitation, and education systems. This in turn poses a growing threat to levels of food insecurity, malnutrition, and poverty, particularly for the poorest and most vulnerable segments of the population.

- a. The last population census for which data are available was conducted in 2000. Data have been collected for the 2010 census, but are not yet available.
- b. According to the 2000 census, Zambia's population was projected to grow from 9,885,591 in 2000 to 13,273,571 in 2010 (Figure 1).
- c. In Zambia, 64% of the population resides in rural areas and 36% in urban. Zambia is therefore highly urbanized by regional standards (Figure 2).
- d. The 2000 census projects urban populations to nearly double between the years 2000-2025.
 - Providing this growing population with reliable access to nutritious and culturally acceptable foods at tolerable prices is critical for reducing poverty, stimulating economic growth, and improving the nutritional status of Zambians.
- e. Crop forecast surveys also record increases in the number of farm households in Zambia (Figure 3).
 - This is contributing to the increasing fragmentation of landholdings and decreases in the mean farm size.
- f. In Zambia, populations are concentrated along the *line of rail* and the Copperbelt provinces where most of Zambia's industrial activities take place and where the majority of urban centers are located (Map 1).

Map 1. Population Distribution in Zambia

2.2. Poverty and Malnutrition

While the overall poverty rate in Zambia has declined over time, poverty rates in rural Zambia remain stubbornly high, with 80% of the rural population living in poverty. Furthermore, children living in rural areas of Zambia disproportionately exhibit signs of stunting, underweight, and wasting than their urban counterparts.

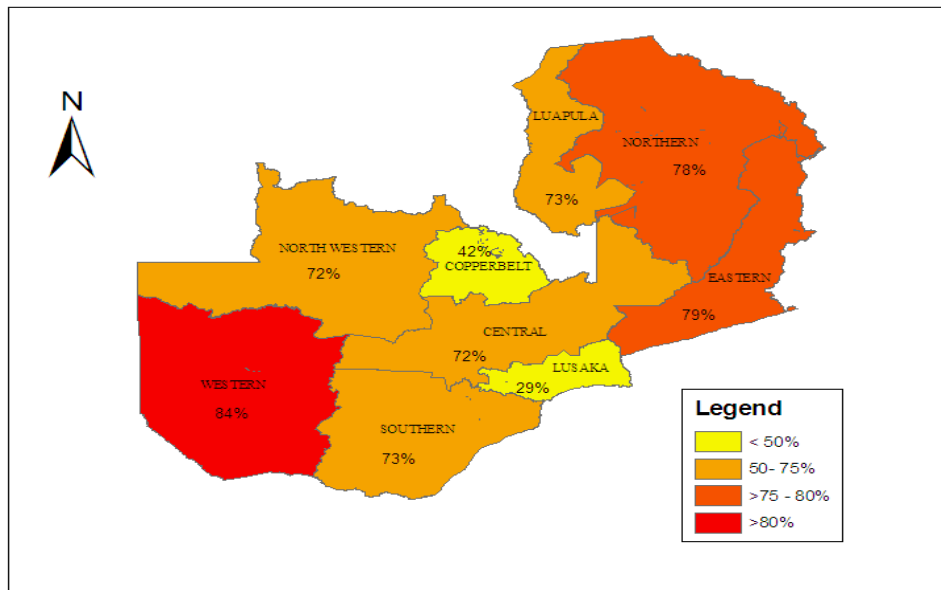

- Incidences of people living in extreme poverty have a distinct geographic distribution, with people living in outlying regions experiencing a higher incidence of extreme poverty than those in regions more accessible to the major population centers (Map 2). Furthermore, poverty is significantly higher in rural than urban areas (Figure 4)
- Provinces located far from the line of rail, yet with relatively more dense populations have the greatest numbers of people living in extreme poverty. These provinces are Eastern Province, with 1,049,142, and in Northern Province, with 948,741 people live in extreme poverty (Map 3).
- Incidences of stunting, underweight, and wasted children are higher in rural Zambia than in urban: 56.6 % of children exhibiting sign of stunting in rural Zambia compared to 47.8% in urban. Yet, with a national average of 53% of under 5 children exhibiting signs of growth stunting, under-nutrition must be considered a national epidemic in Zambia.
- In terms of absolute numbers of children who are stunted and underweight, the provinces of Eastern and Northern again are the highest, due in part to the high levels of poverty and relatively higher population densities than in other more sparsely populated and remote provinces (Maps 4 and 5). However, in terms wasting, the provinces of Southern and Northwestern have the highest number (Map 6). Wasting is normally brought on by a dramatic short-term shock, such as an acute absence of food or disease. Thus, while in Northern and Eastern Province children more often experience issues of chronic food access and nutrition problems, contributing to high levels of stunted and underweight children, more people in Southern and Northwestern Provinces experience short-term and acute food and nutrition problems, leading to higher numbers of wasting children.

2.3. Nutrition Analysis for Zambia

2.3.1. Underlying Causes of Malnutrition in Zambia by Region

Despite its rich agricultural resources, Zambia has continued to experience chronic food and nutrition security problems (Table 1). Stunting at 45% and 21% being severe, remains the most common nutritional disorder affecting under five years children in Zambia, above the Sub-Saharan Africa average of 42%; and (ZDHS 2007). Stunting peaks at 18-23 months when 59% are below -2SD (moderate or severe). Stunting is a proxy indicator for national development, inversely related to household wealth, high in all wealth quintiles (48% and 33.2% in the lowest and highest quintiles respectively.) Stunting also decreases with increasing levels of mother's education. Zambia District Health Surveys (ZDHS 2007, p. 162) indicate that children born to mothers with no education are more likely to be stunted (44.6 %) than children born to mothers with a secondary education (38.6 %).

Wasting (5%), a short-term effect reflecting more recent or acute weight loss, can be a result of recent illness, sudden lack of appetite or inadequate food intake causing muscle and fat loss.

Underweight (15%) is a composite index for stunting and wasting. A child can be underweight for age because of stunting, wasted, or both. Weight for age is a good overall indicator of a population's nutritional health.

Table 1. Rates of Stunting, Underweight, and Wasting among Children under 5 Years of Age; Low Body Mass Index among Women of Reproductive Age, by Province

Province	Children <5 years (%) (stunting)		Children < 5 years (%) (underweight)		Children < 5 years (%) (wasting)		Women (%) with BMI ¹ < 18.5
	Ht/age -3	Ht/age -2	Wt/age -3	Wt/age -2	Wt/ht -3	Wt/ht-2	
Central	25.0	52.7	2.4	15.2	2.8	5.9	9.3
Copperbelt	20.1	43.8	1.8	14.9	0.6	2.3	7.4
Eastern	23.9	49.5	2.1	12.7	1.0	3.6	6.6
Luapula	32.0	56.3	3.1	17.7	3.1	5.4	13.4
Lusaka	14.7	37.2	2.6	9.7	1.2	4.4	7.8

a. Situation Analysis. The most nutritionally vulnerable population groups are pregnant and lactating women, whose bodies must cope with the additional nutritional stresses and demands of pregnancy and lactation, and infants and young children up to age two. Several factors contribute to this scenario, ranging from poor infant and young child feeding practices, inefficient policies and inadequate human resources in agriculture and food sectors, inadequate access to energy from food to meet their energy requirements.

Food insecurity is the major underlying cause of malnutrition in Zambia. Only 36% of households in Zambia have *enough food to eat*, while 19% of households *seldom or never* have enough to eat, categorizing them as *chronically food insecure*. This is consistent with data indicating that 64% of Zambians live below the international poverty line (53% Sub-Saharan average) and that 36.5% live in *extreme poverty*.² Some dimensions of food security of concern in Zambia include seasonal fluctuations in access to sufficient food resulting in quantitative deficit of energy, generally matched by deficits in food quality reflected in insufficient essential micronutrients including vitamin A, iron, zinc, folate, and many others; adequate quantity to meet energy needs of growing children and adolescents as well as pregnant and lactating women and working adults; dietary diversity that provides essential micro and macro nutrients needed for good health; and distribution of food stocks within the country to enable those who must purchase food to do so.

Using the UNICEF (1980) conceptual framework, (in Maxwell and Frankenberger 1992) three main underlying determinants of nutritional status are identified; thus household food security, quality of feeding and care giving practices and the healthy environment and access to health care services, providing feasible points of intervention entry. See Figure 5. This paper focuses on household food security window.

Suffice to note that while food production and household food security, income and in many cases food consumption and diet quality increase, childhood malnutrition persist. This leads to the conclusion that increasing agricultural production and income are probably necessary but not sufficient conditions to reducing malnutrition. There is need to cast the net wider beyond food security issues.

¹ Body mass index (BMI) is used to measure thinness and obesity. It is defined as weight in kilograms divided by height in metres squared (kg/m²). A cut-off point of 18.5 is used to define thinness or acute under nutrition and a BMI of 25.0 or above usually indicates overweight or obesity. [BMI <16.0 implies severe under nutrition, BMI 16.0 – 18.4 implies moderate under nutrition, BMI 18.5 – 24.9 implies adequate weight for height, BMI 25.0 – 24.9 implies overweight and BMI > 30 indicates obesity].

² Rural poverty has declined from 92% in 1993 to 76.8% in 2006 but remains high relative to other Sub-Saharan African countries.

Figure 5. Conceptual Framework for the Determinants of Nutritional Status

Impacts that are far more substantial ought to be achieved when agricultural interventions incorporated nonagricultural interventions that addressed other determinants of child nutrition. These other determinants include maternal health-seeking and care giving practices. Arming women with knowledge about appropriate child feeding practices, importance of child feeding practices and different micronutrients and food sources in which those nutrients are available is a particularly effective way of improving child health and nutrition outcomes.

Incorporating nonagricultural criteria like health and nutrition into the design and conduct of agricultural programs to improve nutrition suggests developing an effective interface between agricultural and other institutions. Yet systematic high-level coordination between sector ministries is challenging given the bureaucratic barriers that typically divide them. Nonetheless, these bureaucratic divides can be overcome through programs and interventions carried out at local community level. Successful projects must invest broadly in improving human capital and sustained and increased livelihood assets of the poor.

b. Child Nutritional Status. Infant and young child feeding practices and a high prevalence of illness and infection are important determinants of nutritional status. Feeding practices are far from optimal making children more vulnerable to growth faltering and malnutrition in the first two years of life than at any other time in the life cycle. Inadequacies in complementary feeding are common with foods of low nutrient density being the norm and with little consumption of foods of animal source by children in low income households. Meal frequency and consistency leaves much to be desired. Using dietary diversity as a measure, 2007 DHS survey found that only 25% of children 6-23 months receive a minimum acceptable diet (ZDHS 2007, page 172).

Most stunting occurs during the first two years of life at which time children have a particularly high demand for nutrients but face serious limitations in the quality and quantity of their diets, usually beginning at the age of 4-6 months. As shown in Figure 6 below, stunting increases with age through the first two years of life before declining steadily in the third and fourth year. The increase is especially rapid during the first two years of life as evidenced in the rise from 26% among children 6 – 8 months to 59 months among children age 18 – 23 months, providing a window of opportunity for interventions.

Figure 6. Nutritional Status of Children by Age

Source: ZDHS 2007.

c. Maternal Nutritional Status. The nutritional status of a woman before and during pregnancy is important for a healthy pregnancy outcome, an important factor for her own quality of life as well as for the health of her children. In Zambia, an estimated 10% of women of reproductive age have a low body mass index (BMI) - below 18.5 - while an estimated 11% of infants are born low birth weight.³ A BMI under 18.5 usually implies particularly low caloric intake and/or particularly high caloric expenditure (arduous labor), but often also suggests that the woman was malnourished as a young child.

Low maternal body-mass index is associated with intrauterine growth restriction. Size at birth, in turn, is an important indicator of the nutritional status of children. Children (44%) with an average size or larger at birth (a proxy indicator for birth weight adequacy in the absence of birth weight measurement) are less likely to be stunted than children small or very small at birth (63%). Stunting also is slightly higher among children who are less than 24 months apart than among first born children or those with a larger birth interval.

d. Micronutrient Deficiencies. Deficiencies of key vitamins and minerals continue to be pervasive, overlapping considerably with problems of general under nutrition (underweight, wasting, and stunting). Data on micronutrient status in Zambia is less readily available,⁴ but existing evidence indicates that micronutrient deficiencies continue to be prevalent. Dietary micronutrient deficiencies of vitamin A and iron are the most widespread, disproportionately affecting women and young children. Vitamin A deficiency has traditionally been a public health problem in Zambia due to inadequate dietary intake. A 1997 national survey showed a prevalence of vitamin A deficiency of 65.7% and 21.5% in women and children respectively. However, no surveys have been conducted since the Ministry of Health began distributing vitamin A supplements during the bi-annual child health weeks and sugar fortification introduced.

³ Low birth weight (LBW) is defined by WHO as <2.5 kg. Yet there is strong evidence that the child's likelihood of survival and subsequent normal growth are substantially higher for infants with birth weights >3.0 kg than for infants between 2.5 and 3.0 kg. The percentage of infants born <3.0 in Zambia as in most developing countries is likely to be more than double the official low birth weight percentage.

⁴ Recognizing shortcomings indicated here, UNICEF is planning both a national food consumption survey and a micronutrient survey.

Shortage of nutrients in diets limit growth, weaken immunity, cause xerophthalmia (an irreversible eye disorder leading to blindness), and increase mortality. Iron deficiency is estimated to be the most prevalent nutritional deficiency. Anemia prevalence is 53% (2003) among children 6 – 59 months and 46.9% (1999) among pregnant women: as many as 50% of women attending antenatal clinics are affected. At least 50% of anemia is caused by inadequate iron intake, the major cause being low consumption of animal source foods, particularly in low income households. In young children, iron deficiency impairs growth, cognitive development, and immune function. In school-age children, it affects school performance, and in adults, it lowers work capacity. Iron deficiency anemia is responsible for tens of thousands of maternal deaths each year.

Although no studies have been conducted on zinc deficiency in Zambia, there is evidence internationally of an association between levels of absorbable zinc in food supply (usually from animal sources) and stunting prevalence. Zinc is an essential nutrient for normal growth in children and is vital for the immune system; even mild deficiency may increase the risk of infection. Zinc deficiency may be an important contributing factor to stunting given evidence of low animal-source food consumption especially for young children, reliance on maize and other staples from which zinc is poorly absorbed, and frequent infections such as pneumonia and diarrhea which cause significant zinc losses. Other micronutrients of concern in maternal and child health include calcium, folic acid, and vitamin B12.

e. Food Consumption Patterns. Food consumption patterns in Zambia are generally poor, exhibited in monotonous low daily meal frequency and dietary diversity. The best available direct measure of food insecurity is an estimate of daily energy intake manifesting in high stunting rates for children and low BMI for adults. Nearly half of the country's rural population, 45% have daily caloric intakes below 1,750 (an average for individuals of all age groups) per day (FAO⁵ food balance sheet calculation) while their families spend nearly 80% of their incomes on food. Calorie consumption ranges from 1,185 in Luapula province and 2,103 in Lusaka compared with an estimated average daily requirement of 2,750 and 2,600 for men and women respectively. The FAO food balance sheet calculation also indicates that, on average, only two percent of calories consumed by Zambians are from pulses, vegetables, and nuts highlighting the dire need for dietary diversity.

While extreme poverty is more common in rural areas of Zambia, evidence indicates that the poor in urban and peri-urban areas also have challenges obtaining sufficient food as shown in Table 2 below.

At Provincial Level, Lusaka Province had the highest percentage of households that could afford three meals a day at 64%. Luapula province had the lowest proportion of households that could afford three meals at 14% and the highest proportion of households

⁵ FAO food balance sheet reflects calories and protein averages per capita food availability calculated by dividing total food production by population figures. Evidently, results do not reflect inequitable access to the food, storage and cooking losses or intra-household distribution.

Table 2. Average Number of Meals per Day by Sex of Head, Rural/Urban, and Province 2006

Sex of Head, Residence and Province	Average number of meals per day			
	1 Meal	2 Meals	3 Meals	More than 3 meals
Sex of head				
Male Head	5	50	43	2
Female Head	7	51	37	2
Rural/Urban				
Rural	5	61	33	1
Urban	5	32	59	4
Province				
Central	4	55	40	1
Copperbelt	7	41	48	4
Eastern	5	55	40	1
Luapula	4	81	14	1
Lusaka	4	28	64	4
Northern	5	67	26	2
North-western	6	63	29	1
Southern	3	33	63	2
Western	13	61	25	1.0

Source: Living Conditions Monitoring Survey 2006.

that could only manage two meals per day at 81%. Generally, the minimum number of meals that a person requires per day is three including snacks, assumed that would meet the dietary requirements.

However, not all households can afford to consume three meals a day in Zambia, with more than half the number of households not affording to consume three meals a day. About half the total number of households (51%) could afford two meals a day while 5% could only manage one meal a day. Most rural households (34%) could not afford three meals a day while 66% could only manage two meals or less per day. This explains why it is very difficult to accommodate the level of energy and other nutrients in such a limited number of meals, coupled with poor quality. Ideally, a diet should constitute enough food from the staple category (cereals, starchy fruits and root tubers) and at least one food item from each of the other groups (legumes and nuts, dark green leafy vegetables and/or yellow vegetables, animal source food, and fats and fat substitutes) using the food grouping system of meal planning.

In addition, many urban dwellers live in crowded conditions in which poor access to safe water and adequate sanitation (Zambia DHS 2007) significantly increases the risk of infection. In 2008, rising food and fuel prices and the subsequent global recession led to a sharp increase in child malnutrition rates especially in urban areas (National Food and Nutrition Commission 2008.)

2.3.2. Selected Food Value Chains

a. Beans. Beans are low in calories, high in dietary fiber and provide a source of dietary proteins (20%). They are a good source of B-group vitamins (thiamin B1, Riboflavin B2, Niacin and folic acid). Beans also provide the minerals iron, zinc, potassium, selenium, magnesium, and calcium. Note that beans lack sulphur containing essential amino acids. However, these amino acids are nonetheless found in cereals e.g. maize, which also lacks lysine, an amino acids found in legumes. Therefore eating beans and maize provides a complementary effect.

Further, including beans in the diet on a regular basis provide health benefits such as helping weight control. The dietary fiber in beans helps to slow the absorption of

carbohydrates, which may prevent hunger from occurring soon. The high content of dietary fiber in bean especially soluble fiber helps slow the absorption rate of carbohydrate, a factor which moderates blood sugar peaking related to food intake, a positive attribute in diabetes. Further beans are a very good source of resistant starch, which play a role in reducing the risk of colon cancer. The nutrition profile of beans contributes to heart health. It is low in total fat, saturated fat, and sodium while it is high in dietary fiber, especially soluble fiber, folate (B-group vitamin), potassium, and a host of other minerals. Finally, beans help to maintain normal ranges for several risk factors for heart diseases including blood cholesterol, blood pressure, and blood cysteine levels.

Despite the positive attributes highlighted above, beans however suffer some challenges. Anti-nutrient factors in beans reduce amounts of nutrients absorbed by the body. The proportion of iron and zinc that can be absorbed from legumes including beans is typically low due to anti-nutrients such as phytates and polyphenols, which normally bind to the iron and zinc making them unavailable for absorption and therefore body use. Flatulence factors caused by the presence of sugars and polysaccharides that are not digested by the human enzymes pass undigested and get fermented in the large intestines by microorganisms thus producing gas, a factor that may be deemed uncomfortable for some people.

Most beans varieties take a long time to cook. Nonetheless, varieties that are being developed now combine a number of agronomic and consumer acceptance characteristics including low phytate levels and short cooking time.

Opportunities available for beans include processing and cooking methods being available that reduce anti-nutrients factors, including germination, fermentation, and dehulling. Eating beans with vitamin C rich foods enables vitamin C to bind with iron thus making it unavailable for phytate binding, preventing it from being attached to the iron absorption inhibitors thereby increasing its bioavailability. This means that eating beans together with vegetables and fruits enhance iron and zinc absorption.

b. Sweet Potatoes. Sweet potato, not only is it sweet to taste buds but also good for cardiovascular health. This starchy root vegetable is a rich source of antioxidants, vitamins, minerals and dietary fiber that are essential for optimal health. Sweet potatoes are not always orange-fleshed on the inside but can also be a spectacular purple color. The orange fleshed sweet potato intervention not only improved gains in production, incomes, and household food security in Mozambique, but also showed significantly greater nutrition impacts of vitamin A intake when combined with interventions involving women's empowerment, education, and behavior change. The study that measured biochemical indicators also showed reductions in Vitamin A deficiency. Sweet potatoes are low in calories (provide just 90 cal/100 g, on comparison with starch rich cereals) and contains no saturated fats and cholesterol; but are a rich source of dietary fiber, antioxidants, vitamins (provides 40% of the RDA for vitamin C) and minerals like iron, calcium, magnesium, manganese and potassium which are very essential for body metabolism

- Sweet potatoes are a store-house of starch, a complex carbohydrate, which raises blood sugar levels *slowly* on comparison to simple sugars; therefore, recommended as a healthy food supplement even in diabetes. It is an excellent source of *flavonoids* like beta carotene and vitamin A (*provides 14187 IU of vitamin A and 8509 mcg of β -carotene*). Vitamin A is also required by the body to maintain integrity of healthy

mucus membranes and skin. It is also vital nutrient for vision. Consumption of natural vegetables and fruits rich in flavonoids helps to protect from lung and oral cavity cancers. Sweet potato is packed with many essential vitamins such as pantothenic acid (vitamin B5), pyridoxine (vitamin B-6) and thiamin (vitamin B-1), niacin and riboflavin. These vitamins are essential in the sense that the body requires them from external sources to replenish. These vitamins function as co-factors for various enzymes during metabolism. There are surprisingly a number of nutrient categories responsible for the health benefits of this underappreciated tuber, among which categories are antioxidants, anti-inflammatory nutrients, and blood sugar-regulating nutrients. Each category brings with it valuable health benefits.

- **Antioxidants:** Sweet potatoes contain a wealth of orange-hued carotenoid pigments. They have a highly effective way of providing school age children with sizable amounts of their daily vitamin A. In some studies, sweet potatoes have been shown to be a better source of bioavailable beta-carotene than green leafy vegetables. Because sweet potatoes are available in on a virtual year-round basis, their ability to provide beta-carotene antioxidant makes them a standout antioxidant food. Particularly in purple-fleshed sweet potato, antioxidant anthocyanin pigments are abundant. Recent research has shown that particularly when passing through our digestive tract, sweet potato cyanidins and peonidins and other color-related phytonutrients may be able to lower the potential health risk posed by heavy metals and oxygen radicals. Storage proteins (sporamins) in sweet potato also have important antioxidant properties. Orange-fleshed sweet potatoes may be one of nature's unsurpassed sources of beta-carotene. Several studies have shown the superior ability of sweet potatoes to raise the blood levels of vitamin A. In several studies from Africa, sweet potatoes were found to contain between 100-1,600 micrograms to meet 35% of all vitamin A needs, and in many cases enough to meet over 90% of vitamin A needs (from this single food alone).

Biofortified orange-fleshed sweet potato (OFSP) has heightened potential. Unlike most staple crops, even unimproved OFSP is rich in vitamin A and is promising for a number of reasons. It contains very high levels of carotenoids; it is well accepted by young children proving a good source of energy. It is easy to cultivate, is vegetatively propagated, and fairly drought-resistant once established, qualities making it an excellent food security crop. It is also less labor-intensive than most other staple crops, and this is particularly helpful to labor-constrained households, such as those affected by HIV/AIDS. It can be planted over a broad range of time without considerable yield loss and can fill some seasonal gaps in energy and vitamin A intakes. Finally, prices are generally low enough that families will choose to keep some OFSP for home consumption, rather than selling all they produce.

- **Anti-Inflammatory Nutrients:** Anthocyanin and other color-related pigments in sweet potato are equally valuable for their anti-inflammatory health benefits. Their phytonutrients have a profound impact effect on fibrinogen, a key glycoproteins in the body that is required for successful blood clotting. With the help of a coagulation factor called thrombin, fibronogen gets converted into fibrin during the blood clotting process. Balanced amounts of fibrinogen, thrombin, and fibrin are a key part of the body's health.
- **Blood Sugar Benefits:** Many people think that this starchy root crop could not possibly be helpful for controlling their blood sugar, realizing that food starches

can be converted by the digestive tract into simple sugars. If foods are especially concentrated in starch, there can often be a risk of too much simple sugar release in the digestive tract and too much pressure upon the bloodstream to uptake more sugar, a situation resulting in an overly quick elevation of the blood sugar level. However, what is fascinating about sweet potatoes is their ability to actually *improve* blood sugar regulation—even in persons with type 2 diabetes. While sweet potatoes contain a valuable amount of dietary fiber, (just over 3 grams per medium sweet potato) if boiled or steamed can carry a very reasonable glycemic index (GI) rating of approximately 50.

Recent research has shown that extracts from sweet potatoes can significantly increase blood levels of adiponectin in persons with type 2 diabetes. Adiponectin is a protein hormone produced by fat cells, and serves as an important modifier of insulin metabolism. Persons with poorly-regulated insulin metabolism and insulin insensitivity tend to have lower levels of adiponectin; those with healthier insulin metabolism tend to have higher levels. While more research on much larger groups of individuals to further evaluate and confirm these blood sugar regulating benefits, this area of health research is an especially exciting one for anyone who loves sweet potatoes.

- **Other Health Benefits:** One of the more intriguing nutrient groups provided by sweet potatoes are resin glycosides. These nutrients are sugar-related and starch-related molecules that are unusual in their arrangement of carbohydrate-related components, and in their inclusion of some non-carbohydrate molecules. Sweet potatoes contain one group of resin glycosides called batatins (including batatin I and batatin II). Recently researchers discovered a related group of glycosides in sweet potato called batatosides (including batatodide III, batatoside IV, and batatoside V). In laboratory studies, most of these sweet potato glycosides have been shown to have antibacterial and antifungal properties. To what extent these carbohydrate-related molecules in sweet potatoes can provide us with health benefits in these same antibacterial and antifungal areas is not yet clear.

c. Horticulture. Agricultural interventions promoting increased production of fruit and vegetable carry considerable potential to effectively address micronutrient deficiencies. A significant body of evidence documenting the success of homestead gardens in raising production, income, household consumption and the intake of targeted fruit and vegetable by vulnerable population groups exist. Several programs also show significant impacts on dietary and biochemical indicators of micronutrient deficiencies, and especially so when they include components designed to change behavior through education and to empower women.

It is hoped that households will earn incomes by selling the fruits and vegetables. The main use of this income should be for food and also to invest in seeds, seedlings, saplings or other income-generating activities as well as save income. Households with improved homestead gardens should consume micronutrient-rich, non-cereal foods more frequently. In turn, foods, such as beans and animal products, may not actually be produced in the garden, but purchased using income generated from the selling of garden produce. Chicken liver is a particularly rich source of vitamin A and other essential micronutrients. Egg consumption should be encouraged to increase disproportionately among women and children. Nutrition education should emphasize both intra-household distribution issues and micronutrient consumption and focus on the special needs of women and young

children. Horticultural crops under consideration include tomato, rape, onion and indigenous vegetables (sweet potato leaves, pumpkin leaves, cassava leaves), mangoes, bananas and oranges. These will be considered in turn below:

- Tomato: Tomato can be considered either a fruit or vegetable. Though technically a fruit, tomato is used as a vegetable for cooking purposes. Tomatoes have a number of important nutrients and are believed to accord a number of nutritional benefits to their users. Tomato is a good source of calcium and iron. It also contains some phosphorus, sulphur, potassium and some vitamin A. It is rich in vitamin C which increases as the vegetable ripens. 100 g of tomato contains only 20 calories, which are easy to absorb by the body. The low calorie content of tomato makes it a favourite for obese people as it fills the stomach and does not add calories.

The presence of antioxidants in tomatoes helps in cleansing toxic compounds from the body. Lycopene, present in tomatoes, neutralize free radicals in the body, reducing the risk of prostate cancer and heart attack. Eating raw tomatoes reduces the risk of developing rectal, colon or stomach cancer. Tomatoes block the effects of nitrosamines and thus, reduce the risk of lung cancer. Vitamin K present in tomatoes helps in keeping the bones strong and healthy. It also helps prevent hemorrhages. Consuming raw tomato on a regular basis helps improve the skin texture, making it glow. Tomatoes are known to have blood purifying properties protecting the liver from cirrhosis and dissolves gallstones as well. Being a natural antiseptic, tomatoes help to protect the body against various common infections. Nicotinic acid in tomatoes is credited with reducing blood cholesterol, which in turn helps keep heart diseases at bay. Studies have shown that consumption of tomatoes and tomato based products prevents serum lipid oxidation and reduces the risk of macular degenerative disease. When applied topically, tomato pulp helps heal wounds and sores.

- Onion: Onion is a vegetable cultivated in almost all countries of the world and consumed across the globe used for cooking purposes. Not only does the vegetable lend an excellent taste to dishes, but is also associated with imparting a number of health benefits to its users. Onions have therapeutic, antibacterial, antifungal and load of other beneficial properties. Fresh as well as cooked onions have anti-platelet adhesiveness, which helps in preventing thrombosis. Onion is very good for those suffering from high blood pressure, helps reduce inflammation and is therefore, beneficial for those suffering from Neuritis, Vertigo, and Bronchitis. Onion, being a diuretic, increases the secretion of urine. It is rich in flavonoids and thus, provides protection against cardiovascular disease.

Onions contain a number of sulfides that help in lowering blood lipids; have anti-allergy properties, apart from being slightly laxative. They help drain out mucus from the cavities and loosen phlegm, in turn alleviating symptoms of sinus. They also help the body in destroying worms and other parasites. They have a property of helping lower blood sugar, hence are good for people suffering from diabetes. Extracts of onion, being rich in a variety of sulfides, provide some protection against tumor growth. In addition, onions have been found to be helpful in the alleviation of the following ailments: asthma, bacterial infections, cough, colds,

influenza, insomnia, obesity, pneumonia, tuberculosis, neuritis, vertigo, and bronchitis.

- **Rape:** Rape, classified as group A vegetable are rich in vitamins B1, B2, C, carotene, and a variety of inorganic salts and large amounts of water, usually 70% to 90%. Being a dark green vegetable, rape is a rich content of nutrition, right from protein, vitamins, potassium, phosphorus, magnesium, calcium to selenium, iron, manganese, copper, and zinc. A high vegetable diet assures a relief from all the major and minor problems of the body. People consuming greater amounts of vegetables in their diet are high on energy and feel less lethargic or stressed out. The nutrition provided, helps body perform all the activities, by providing the body cells and organisms, all the necessary requisites for supporting life.
- **Sweet Potato Leaves:** Sweet potatoes leaves are not only delicious, nutritious and exceptionally easy to prepare – they are also versatile, having great nutritional profile. Sweet potato leaves are edible; containing more nutrients and dietary fiber than some green leafy vegetables like spinach (e.g. 100 g sweet potato leaves provide 1028 IU of vitamin A). They can also be dried and preserved for use to add culinary taste and in the lean periods. High consumption of vegetables and fruits has been linked epidemiologically to decreased risk of cancer and cardiovascular disease, beneficial effects attributed partly to the presence of numerous polyphenolic compounds, which display antioxidant and free radical scavenging properties. Polyphenols are the major phytochemicals in fruits and vegetables. A variety of *in vitro* studies have shown that polyphenols such as flavonoids are antioxidants, immunomodulators, and exhibit antigenotoxic effects. Sweet potato leaves are easily grown and have the highest polyphenolic content, in particular, flavonoids, of all the commonly grown vegetables, therefore supplementation of diets with sweet potato leaves would be prudent. As with many vegetables and fruits, sweet potato leaves are rich in carotenoids, whose immunomodulatory activity in animals and human beings is well known.
- **Pumpkin Leaves:** Pumpkin leaves and flowers can be cooked as vegetables, an incredibly rich source of vital anti-oxidants and vitamins. This humble vegetable is very low in calories yet good source of vitamin A, flavonoid poly-phenolic antioxidants like leutin, xanthins, and carotenes. It is one of the vegetables which is very low in calories; providing 26cal per 100g and contains no saturated fats or cholesterol; but is a rich source of dietary fiber, anti-oxidants, minerals, vitamins such as A, C and E, recommended in cholesterol controlling and weight reduction programs. With 7384 mg per 100 g, it is one of the vegetable in the cucurbitaceae family with highest levels of vitamin-A, providing about 246% of RDA. Vitamin A is a powerful natural anti-oxidant and is required by body for maintaining the integrity of skin and mucus membranes. It is also an essential vitamin for vision. Pumpkin leaves are also an excellent source of many natural poly-phenolic flavonoid compounds like alpha and beta carotenes, cryptoxanthin, leutin and zeaxanthin. Zea-xanthin is a natural anti-oxidant, which has UV (ultra-violet) rays filtering actions in the macula lutea in the retina of the eyes; thus, helping protect from *age related macular disease* (ARMD) in the elderly. Pumpkin leaves are also rich in B-complex group of vitamins like folates, niacin, vitamin B-6 (pyridoxine), thiamin, and pantothenic acid and a rich source of minerals like copper, calcium, potassium, and phosphorus.
- **Cassava Leaves:** Young cassava leaves are a popular vegetable due to the high content of protein, minerals, and vitamins. According to studies, consumption of

400g cassava leaves is equivalent to protein intake of 45 to 50 grams. It contains vitamin A, vitamin B1 vitamin C, calcium, calories, phosphorus, protein, fat, carbohydrate, and iron. Cassava leaves contain 15 to 20 times cyanide compared to roots. But this is easily degraded during cooking.

d. Chickens. Program and interventions involving animal source foods have even greater potential to tackle micronutrient deficiencies, especially vitamin A, Iron and Zinc deficiencies. These micronutrients are more readily bio-available in animal source foods than plant foods. Chicken makes a delicious, flavorful, and nutritious meal. It is no wonder chicken is the world's primary source of animal protein and a healthy alternative to red meat. It is available to enjoy throughout the year.

Chicken is rated as a very good source of protein, providing 67.6% of the daily value for protein in 4 ounces. Chicken provides an alternative source of meat for people who wish to reduce the amount of fat in their meals. The leanest part of the chicken is the chicken breast, which has less than half the fat of a trimmed Choice grade T-bone steak. The fat in chicken is also less saturated than beef fat. However, eating the chicken with the skin doubles the amount of fat and saturated fat in the food.

Chicken is a very good source of the cancer-protective B vitamin, niacin. Components of DNA require niacin, and a deficiency of niacin (as well as other B-complex vitamins) has been directly linked to genetic (DNA) damage. A four-ounce serving of chicken provides 72.0% of the daily value for niacin.

Chicken is also a good source of the trace mineral, selenium, of fundamental importance to human health. It is an essential component of several major metabolic pathways, including thyroid hormone metabolism, antioxidant defense systems, and immune function.

Chicken is not only a very good source of niacin, but is also a good source of vitamin B6. This particular mix of B-complex vitamins makes chicken a helpful food in supporting energy metabolism throughout the body, because these B vitamins are involved as cofactors that help enzymes throughout the body guide metabolic reactions.

Both of these B vitamins are important for energy production. In addition to its DNA actions, niacin is essential for the conversion of the body's proteins, fats, and carbohydrates into usable energy. Niacin helps optimize blood sugar regulation via its actions as a component of a molecule called glucose tolerance factor, which optimizes insulin activity. Vitamin B6 is essential for the body's processing of carbohydrate (sugar and starch), especially the breakdown of glycogen, the form in which sugar is stored in muscle cells and to a lesser extent in our liver.

In addition to its role in energy metabolism, vitamin B6 plays a pivotal role as a methyl donor in the basic cellular process of *methylation*, through which methyl groups are transferred from one molecule to another, resulting in the formation of a wide variety of very important active molecules. When levels of B6 are inadequate, the availability of methyl groups is also lessened. One result of the lack of methyl groups is that molecules that would normally be quickly changed into other types of molecules not only do not change, but accumulate. One such molecule, *homocysteine*, is so damaging to blood vessel walls that high levels are considered a significant risk factor for cardiovascular disease.

e. Free Range Eggs. Free range eggs means the chicken was allowed to roam, picking what it wanted to eat. Research has shown that cage-free hens have produce eggs higher in various vitamins. Chickens packaged tightly in cages undergo stress, lowering their immune systems and raising their likelihood of infection. Many times, chickens are given regular antibiotics to help keep down infection rates. These antibiotics may lead to stronger, more resistant bacteria in the feces of the chicken and even in that of the farmer who raises them. This presents two big potential problems for the consumer: 1) antibiotics like sulfa in the chicken that could aggravate drug allergies, and 2) super resistant bugs. Free-range eggs actually show greater resistance to bugs like salmonella. On this account free range eggs offer the best alternative.

Eggs are probably one of the most nutritious foods that easily find space on every supermarket shelf round the world. Apart from being inexpensive, they are delicious and packed with a wealth of essential components required by the body. Eggs are a rich source of high-quality protein and amino acids that are indispensable for a healthy body. Eggs are a great source of protein and numerous vitamins, including vitamin A, potassium, and many B vitamins like folic acid, choline, and biotin, are also packed into this oval-shaped staple. In fact, very few foods share the same diverse nutrient makeup available in a single egg. Many of these are specifically needed for the health of the nerves and the brain. Due to the presence of carotenoids like lutein and zeaxanthin, eggs check macular degeneration caused by ageing. Eggs also defend and improve eyesight by preventing diseases like cataract. Due to high vitamin D content, consuming eggs gives rise to strong and healthy bones. Eggs are also rich sources of vitamin E that is important for combating free radicals and ensuring cell protection. Eggs also contain phosphorus that helps in the development of healthy teeth and bones. Iron present in eggs helps in the formation of red blood corpuscles (RBC's) in the body. Zinc present in eggs aids in normal functioning of the immune system. Consuming eggs prevents different types of cancers, including breast cancer. Due to high sulphur content and presence of many vitamins and minerals, eating eggs helps in the promotion of healthy hair and nails. Chlorine that forms an essential component of eggs, boosts memory power and brain functioning. An important antioxidant called selenium is also found in eggs that curbs damages caused by unrestrained oxidation in the body, and thus prevents blood clots, strokes, and heart attacks.

f. Maize. Maize is the most important grain crop in Zambia, being both the major feed grain and the staple food for the majority of the population. Maize has a wide variety of uses that ranges from both human to industrial. Maize meal is a staple food and high volumes are traded monthly. Maize is a rich source of carbohydrates, Vitamin B1, Vitamin B5, and Vitamin C, dietary fibers, proteins, and minerals. Presence of thiamin in maize helps in keeping memory power intact; thereby prevent the dreaded Alzheimer's disease. Folate, a good source of niacin, helps in preventing birth defects and helps in lowering the level of Homocysteine that has the potential of damaging the blood vessels. Humans eat maize or corn in the form of popcorn, porridge, beverage, etc. In terms of industrial usage, the grains of the maize are used in the transformation of plastics and fabrics. Ethanol, produced from maize, is being used as an additive in gas to prevent pollution levels and reduce the use of petroleum. Consumption of corn also prevents the occurrence of lung cancer, as it is rich in beta-cryptoxanthin, an orange-red carotenoid found in corn in large proportion.

g. Groundnuts. Groundnuts are an important source of cheap protein, more than meat and two and half times more protein than that obtainable from eggs. They suffer the

misconception of being a fatty food because of the oil content. However, research has shown that its oil is actually nutritious, packed with mono-unsaturated fats. They are also not lacking in antioxidants that help reduce the risk of cancer and heart disease as well as have anti-aging properties contributing to a younger look.

Groundnuts provide five main nutrients required by the body in good quantity to maintain and repair the tissues namely food energy, protein, phosphorous, thiamin, and niacin. Groundnuts are also rich vitamins and contain at least 13 different types of vitamins that include Vitamin A, B, C and E. along with this, groundnuts are also rich in 26 essential minerals like calcium, iron, zinc, boron, etc. these help in brain function and development and also help to maintain strong bones. Groundnuts possess healing properties, are easily digested, and serve as a mild laxative. They are also known to boost the immune system. Groundnuts build resistance against such diseases as hepatitis and tuberculosis.

In addition, groundnuts and their products are very beneficial in the treatment of hemophilia and other such inherited blood disorders. People suffering from nose bleeding also benefit from eating groundnuts and they are also helpful in reducing excessive menstrual bleeding in women. They have also proven effective in the treatment of obesity. Roasted groundnuts could be taken before lunch. They do a good job in lowering appetite, which could contribute to weight loss. Diabetics should consider groundnuts as a boon because it addresses niacin deficiency. It also minimizes the risk of vascular complications.

In the absence of dairy milk or avoiding it for health reasons, groundnut milk can serve as an alternative that is as nutritious as dairy milk. As beneficial as groundnuts are, moderation should be exercised in consumption because in excess could give rise to acidity in the stomach. Excessive should be avoided by asthmatics, much in the same way as in those with gastritis and jaundice as it could lead to indigestion and heartburn. It is recommended that growing children, expecting women and nursing mothers consume roasted groundnuts with. It is said to provide resistance and immunity against dangerous infections like hepatitis and tuberculosis. Groundnuts are rich in anti-oxidants and a chemical called resveratrol. These help in reducing the risk of contracting cardiovascular diseases, cancer risk and help in anti-ageing, thus keeping the body young and fit.

h. *Cassava Value Chain*. In Luapula and Northern provinces, cassava is the staple food. The major advantage of cassava is that both tubers and leaves are consumed. In addition many products can be made from chips, flour and starch commercial purposes. With the increase in food prices and population trends towards urbanization, many products can be made from cassava, offer interesting nutritious and palatable options for consumers. Low levels of cassava utilization in Zambia clearly show that many households are not aware of the wide range of possible products available for domestic consumption and input into the food industry. Under-utilization of cassava is therefore a limiting factor to increased and sustained production.

Cassava is mainly composed of starch (carbohydrates) as the source of energy, fiber, minerals, and vitamins. The tubers have very low protein levels (though of high quality) in comparison with cereals and this forms the common criticism of cassava crop. However, the leaves are richer in protein. Some varieties that have yellow fleshed roots contain β -carotene. In cassava-based farming systems where cassava is the staple food, if the diet is not balanced people, especially children under five years of age are at greater risk of malnutrition. Use of protein rich foods such as groundnuts, soya beans, beans,

cowpea, cassava leaves, and kapenta etc. in combination with cassava products overcomes the protein inadequacy.

The major challenge for cassava is that of high cyanide content in bitter varieties. The danger of having high levels of cyanide in consumed cassava is that most animal protein is diverted to detoxify cyanide resulting in growth retardation. It is for this reason that cassava should be properly processed to remove the toxins.

Despite the low utilization levels, cassava root is utilized in many food preparations in Zambia. The most commonly consumed cassava products include nshima, boiled roots, roasted chips, and leaves. In addition, many other products can be made for household consumption and for sale to increase household income. Eating places such as restaurants and hotels should be encouraged to promote cassava products.

Constraints for cassava are manifold, including inadequate accessibility to drying equipment and tools increases post harvest losses, especially during the rainy season and the inability to benefit from higher prices during this period. Low adaptability of improved processing technology due to high capital investments result in low quality cassava chips and loss of value addition. Further, inadequate access to (reliable) water may constrain small scale farmers to explore high value adding processing like starch production and hence limit their income generating opportunities. Inadequate access to capital limits farmers to invest in appropriate processing technology, as a result they are only able to produce low to medium quality chips for local markets. Lastly, cassava is generally perceived a *poor man* food and hence not sought for by the middle and high income earners (with exception of those who were born in cassava growing areas).

Regardless of the constraints, opportunities do abound. These include the promotion of innovative saving and credit systems facilitating access to loans making it possible for farmers to store their cassava instead of being forced to sell immediate after harvesting at low prices. Additionally, the possibility of harvesting the whole year around enables farmers to benefit from seasonal price increases, especially when maize is scarce, resulting in higher returns. Lastly, the deficits in neighbouring countries like the Congo DRC provide ample opportunities for cross border trade and outlets for the farmers' surpluses.

2.3.3. The Role of Women in the Value Chains and Household and Child Nutrition

Women play multiple roles in both agricultural production and nutrition, and interventions that consider trade-offs between their respective roles and their time and labor constraints are more likely to lead to positive outcomes. Successful interventions are more likely to take into account the range of factors that differentially enable or constrain men and women in terms of access to resources like land and services like credit. These influence and often determine their roles as decision makers in the household or community. The significance of gender equity is particularly critical because women's status and decision-making power directly affect the nutritional status of their children.

2.3.4. Major Policy Environments, Current Initiatives, and Enabling Environments

To achieve the policy objective of reducing poverty and improving income distribution, Zambia has employed a number of policy measures embraced in several documents. In the

2030 Vision, Zambia adopted a major development objective, which seeks to accelerate pro-poor economic growth through securing macroeconomic stability, structural reform, and investment in human development. Specific targets are (a) to reduce the poverty head count from 68% to less than 20% of the population living below the poverty datum line (Bank-defined poverty line of US\$1 per day) (LCMS 2007), and (b) to improve income distribution to a Gini coefficient of less than 40 from the current 53. The Sixth National Development Plan (2010) also includes the objective intended to achieve a “well nourished and healthy population by 2030”, specifying five nutrition and food security targets.

Further the national agriculture policy vision is to develop an efficient, competitive and sustainable agriculture sector which assures food security and increased income. The specific objective for this vision is to ensure national and household food security. Note however, that both the vision and specific objective are broad statements not specific to nutrition security, thus evasive. The targeted crops in the long term vision which seeks to achieve food security for the majority of the population through increased yields and improved post management and utilisation include maize, cassava, sorghum, millet, sweet potatoes beans and groundnuts. It is delightful to note that the proposed value chain crops fall within the confines therefore stand to enjoy government support. The aspect of horticulture however, was not specific thus left to interpretation by implementers. Lastly the food and nutrition policy provision is inadequate in as far as the definition for food security is concerned, confined to food security which suffers deficit by most implementers and Politian’s to imply maize security.

Factors that contribute to malnutrition and poor nutrition outcomes are complex and vary across production and consumption settings. Sector specific strategies tend to approach nutrition issues along narrowly disciplinary lines and generally disregard contributing factors that fall outside the purview of that particular field. Agriculture’s roles as the source of food production make its significant contribution to nutrition unquestionable. Yet the persistence of malnutrition as a public health concern despite increasing agricultural production belies any notion that the malnutrition and under nutrition problem can be solved entirely from the supply side by increasing production. Nutrition is intrinsically multi-sectoral, and strategies to improve nutrition outcomes should seek to purposefully integrate the contribution of relevant disciplines. Multi-sectoral efforts intended to simultaneously address agriculture and nutrition have often been hindered by institutional barriers and insufficient resources.

2.4. GDP and the Role of Agriculture in Zambia’s Economy

Zambia has experienced positive GDP growth over the last decade. At the same time, stagnant to moderate growth in the agricultural sector has led to a declining share of agriculture to Zambia’s GDP.

- a. Agriculture in Zambia supports the livelihoods of over 70% of the population (Figure 7). 78% of women in Zambia are engaged in agriculture, compared with 69% of men (Figure 8).
- b. Zambia’s economy has grown steadily in real terms since 2001 (Figure 9). However, the percent contribution of the agricultural sector to GDP has declined from 16% in 2001 to 12.6% in 2009 (Figure 10 and 11).

Source: Ministry of Finance and National Planning, 2010.

2.5. Challenge of Integrating Women into Commercial Agriculture

Empirical evidence from Zambia suggests that gender inequalities can slow down economic growth and poverty reduction (GTZ 2008).

- a. According to the World Bank Strategic Country Gender Assessment for Zambia, women provide 70% of the country's agricultural labor (World Bank 2004).
- b. Women are often disproportionately excluded from resource access, decision-making processes, and are less privileged beneficiaries of public service, such as extension services.
- c. Women farmers more often than men produce agricultural products to meet household consumption needs, which limits their ability to generate an income from agricultural production and marketing.
- d. According to the World Bank: *if women enjoyed the same overall degree of capital investment in agricultural inputs*, including land, output in Zambia could increase up to 15%
- e. Zambia has generated a National Gender Policy, created a Gender in Development Division (GIDD), and assigned a Gender Focal Point within the Ministry of Agriculture and Cooperatives. However, these policies and positions have very little visibility, financing, or training to make meaningful changes on the ground.

III. AGRICULTURAL SECTOR IN ZAMBIA: WHY IS AGRICULTURE A CRITICAL PART OF THE SOLUTION TO FOOD INSECURITY, MALNUTRITION, AND POVERTY IN ZAMBIA?

“No country has ever achieved mass poverty reduction without a prior substantial boost in agricultural productivity” (Timmer 2005)

3.1. Agro-Ecological Zones

- Zambia is made up of four distinct agro-ecological zones, which are based on relative rainfall and soil characteristics (Map 7)
- Due to the relatively higher and consistent rainfall pattern, regions IIa and III are the most productive agricultural zones in the country. Conversely, Region I, located in the southern portion of the country is the most vulnerable to drought induced crop failures. Due to its sandy soils and isolation from major urban centers, Region IIb is the least productive region, in terms of staple maize production, with 61% of smallholder in the region being net maize buyers (see Table 3).

Map 7. Zambia’s Agro-ecological Zones

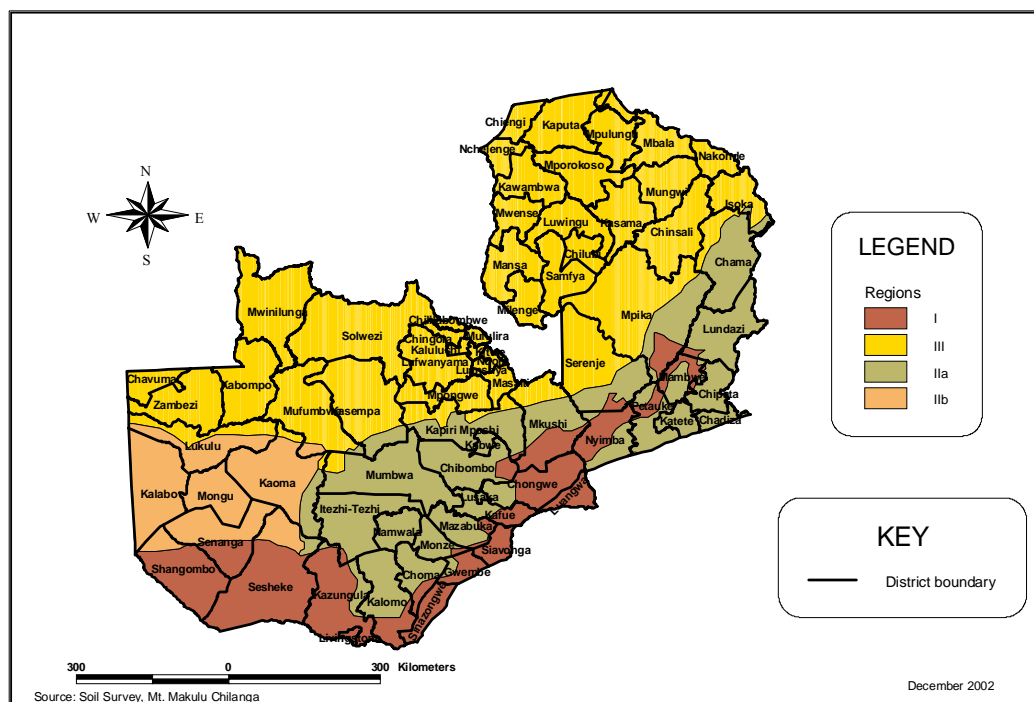

Table 3. Zambia - Household Maize Market Participation Status by Agro-Ecological Zone, 2008

	Region I: low rainfall (under 800 mm)	Region IIa: moderate rainfall (800- 1000 mm), clay soils	Region IIb: moderate rainfall (800- 1000 mm), sandy soils	Region III: high rainfall (over 1000 mm)	Total
Selling maize only	14.4%	16.4%	7.3%	21.2%	17.7%
Buying maize only	51.6%	50.7%	61.2%	41.0%	47.2%
Buying and selling maize (net maize seller)	5.8%	11.9%	3.8%	8.1%	9.2%
Buying and selling maize (net maize buyer)	2.7%	2.8%	4.0%	3.0%	3.0%
Autarkic (no maize sales or Purchases)	25.5%	18.1%	23.7%	26.8%	22.9%

Source: CSO/MACO/FSRP Supplemental Survey 2008.

3.2. Cropping Characteristics

- Small-scale farming systems in Zambia are overwhelmingly dominated by a single crop: Maize. 81.72% of all smallholders grew maize in 2009/10 (Figure 12).
- Cassava cultivation, the second most important staple food crop, is geographic confined to the north and northwestern parts of Zambia (Figure 12 and Map 8).
- Groundnuts, the second most widely cultivated crop in Zambia and important source of protein in Zambian diets, are frequently intercropped with maize (Figure 12). In Zambia, groundnuts are often considered a *women's crop* due to their importance for home consumption.

Figure 12. Percent of Small-Scale Farmers Growing Crop by Year

Source: CFS 2001-2010.

Map 8. Staple Food Zones

3.3. Agricultural Productivity Trends

Productivity growth in Zambia is critical for meeting the food needs of a rapidly growing and urbanizing population.

- Yields per hectare have improved slightly for most crops since 2006, however, much of this improvement is due to favorable weather conditions (Figure 13 and Figure 14).
- Yields for all crops in Zambia are well below global averages (Table 4).
- However, while national yields are low, the top 10% of smallholders achieve yields that are one to nearly four mt more than average depending on the crop. This suggests the potential for yield improvements in Zambia (Figure 13a).
- National production figures for most crops have trended upward over the last three years, but remain erratic and highly susceptible to rain-fall variations (Figures 15 and 16).
- For the primary food crop grown by Zambian farmers, maize, production growth has been mostly driven by area expansion not yield improvements (Figure 17).

Source: GRZ CSO Crop Forecast Surveys 2001-2010.

3.4. Input Use and Access

- One of the primary constraints to yield improvement is limited access to inputs among Zambian smallholders.
- While input use has trended upward since 2001, 60% of Zambia farmers still do not use fertilizer on their fields (Figure 18), while more than 60% do not use hybrid maize seeds (Figure 20).
- Of the farmers using fertilizer, the yield response to fertilizer use is extremely low. In 2010 fertilizer users produced a little over one mt per hectare more maize than none users (Figure 19).

3.5. Farm Structure and Land Sizes

Despite a relatively low population density, growth in the number of rural households contributes to increasing land fragmentation and shrinking land size holding in Zambia (Table 5).

- While the mean land size holding in Zambia is 3.27 hectares, a quarter of the rural population controls on average barely 1 hectare of land (Table 6 and Figure 21 a and b).
- At a provincial level the highest number of rural households with less than one hectare of land is in Eastern Province, followed by Southern and Northern Provinces (Map 9).
- Even with a dramatic improvement in yields, land constrained farmers can never rely on maize or other low value cereal crops as a vehicle out of poverty.

- d. Yet on a national level roughly 420,000 rural households, or 30.5% of all rural households in Zambia, farm on 1 hectare of land AND continue to grow maize.
- e. Investments aimed at creating the conditions for land constrained farmers to move out of maize and toward food crops that provide greater returns per scarce unit of land is critical for reducing rural poverty.
- f. Land constraints are particularly challenging for women farmers. The farm size of female-headed households – both those with a non-resident husband as well as those without a husband – are 0.7 and 0.5 hectares smaller on average than those of male-headed

Table 5. Ratio of Cultivated Land by Rural Population

Country	1960-69	1970-79	1980-89	1990-99	2000-07

3.6. Crop Marketing Behaviors, Market Positions, and Farm Incomes

Variations in land size holdings in Zambia are closely correlated to farm income and the position of farmers in food markets.

- a. In Zambia, 2% of small-medium scale farmers produce roughly 50% of the country's total maize supply. A further 19% produce the other 50% of surplus maize in Zambia. Thus, only 21% of farmers in Zambia are capable to of producing a marketable surplus of maize (Figure 22). These farmers tend to control larger land areas and are generally located in the most favorable agro-ecological zones (Table 7).
- b. Despite the high prevalence of maize cultivation in rural Zambia, 36% of rural households are in fact net buyers of maize (Figure 22). These farmers tend to control smaller farm sizes and tend to be located in more marginal agro-ecological zones.
- c. The implication is that farmers on the small plots of land continue to dedicate scarce land, labor, and capital to maize cultivation in an often futile attempt to meet home consumption needs. Part of the reason for this is the high cost of maize meal in rural areas during the *hunger months*.
- d. Making maize markets work for these rural consumers is important if they are to shift their production systems to higher value food crops, which can generate greater returns per scarce unit of land.

Figure 22. Distribution of the Small-Scale Farmer Population According to Their Position in the Staple Grain Market, Zambia

Source: CSO/MACO/FSRP Supplemental Survey 2008.

Table 7. Characteristics of Smallholder Farmers, Zambia 2006/07

	N=	Farm Size (ha)	Asset Value (US\$)	Gross Rev. Maize Sales (US\$)	Gross Rev. Crop Sales (US\$)	Total hh Income (US\$)
Top 50% of Maize Sales	31,328 (2%)	4.3	1,132	720	1163	2932
Rest of Maize Sales	328,561 (26%)	1.6	316	88	193	634
Households Not Selling Maize	907,255 (72%)	0.9	231	0	97	415

Source: CSO/MACO/FSRP Supplemental Survey 2008

- e. Land size holdings have a dramatic effect on rural household incomes. Households that control the lowest quartile of land make 28 times less from crop sales (Table 8) than the top quartile, and nearly 6 times less total farm income (Table 9).

Table 8. Zambia - Household Shares of Components in Total Crop Sales Income by Landholding Quintiles, National, 2008

Quintile of total HH landholdings	Crops Sales Income (\$US)	Maize Sales	Sales of other staple food crops	Sales of high value food crops*	Traditional cash crops
1 lowest	24	34.8	21.6	42.5	1.1

Note: * primarily fresh fruits, vegetables, and legumes.

- f. The highest share of the income from crop sales generated by the most land poor is from high value food crops, particularly fruits and vegetables (Table 8).
Thus improving the productivity of vegetable cultivation and the market linkages between land constrained farmers and urban consumers is a critical intervention area for lowering and stabilizing the cost of vegetables for urban consumer, while raising returns for the poorest farmers.

IV. DEMAND CHARACTERISTICS IN URBAN ZAMBIA

Providing Zambia's large and growing urban population with reliable access to nutritious and appropriate foods at tolerable prices is critical for improving food/nutrition security and reducing poverty in Zambia.

- Caloric intake among Zambians is overwhelmingly dominated by a single food crop, maize. According to FAOSTat maize accounts for 57% of Zambians' daily caloric consumption (Figure 23).
- Rapid urbanization coupled with stagnant agricultural growth is contributing to an emerging structural deficit in staple foods. As Figure 24 shows, the region of southern Africa has recently become a net importer of maize and maize meal products, despite an overwhelming number of rural farmers producing maize.
- Food prices in Zambia tend to be high and erratic, due to poor market linkages and low and erratic productivity. For example, between 2001-08 maize prices in Lusaka spiked well above import parity on four different occasions (Figure 25). These price spikes are extremely damaging to the food security of Zambians, particularly the poorest and most vulnerable.

Figure 23. Zambia's Kcal/Capita/Day by Crop, 2008

Source: FAOSTAT.

Figure 24. Net Exports of Maize and Maize Meal in Southern Africa

Figure 25. Lusaka Retail Maize Prices versus C.I.F. Prices South Africa

Source: AMIC, Lusaka Retail and SAFEX for South Africa.

- While food expenditure as a share of total household budget has declined in Zambia from 61% in 1991 to 46-55% in 2006/07, the poorest consumers continue to spend an extremely high amount of their total income on food (60-73%).
 - a. The poorest urban consumers spend the highest share of their food budget on maize as their staple carbohydrate (Table 10), and vegetables, particularly tomato, rape, and onion, which can be considered Zambia's staple vegetables (Table 11).
- Investments aimed at lowering and stabilizing consumer prices for maize and vegetables are therefore critical for improving the disposable incomes of the poorest urban consumers in Zambia and assisting them to have reliable access to staple foods at consistently tolerable prices.
 - a. These food crops are also important because the opportunities that exist for improving urban-rural economic growth linkages.

V. PUBLIC SPENDING ON AGRICULTURAL SECTOR

Public spending is overwhelming directed toward maize production and marketing, and therefore is aimed primarily at those more wealthy farmers who are capable of producing a marketable surplus of grain.

- According to the Agricultural Growth and Investment Options Report (Thurlow et al. 2008), for Zambia to achieve the CAADP annual agricultural growth rate target of 6% government spending to the sector must be increased to at least 16% of annual national budget.
- Figure 26 shows actual public spending on agriculture from 2000-2010. Figure 27 shows that current spending on agriculture is just under 10% of the total government budget, which is approaching the spending goal agreed upon under the 2003 Maputo Declaration. (Pink line is actual release, green is allocated, and the difference is driven by changes in FRA and FSP spending).
- While overall spending is growing, it is important to look at how the money is being spent. Figure 28 shows that procurement and distribution of maize through FRA and input subsidies, through FSP/FISP account for over 43% of the total agricultural budget.
 - a. Studies in other countries suggest that agricultural subsidies provide the lowest returns in terms of productivity growth, compared to long-term investments in roads, research and extension, education, and irrigation.
 - b. Disproportionately channeling money into maize subsidies limits the ability of the Zambian government to invest in public goods that can raise productivity and benefit a larger share of the Zambian population.
- Figure 29 shows that while government spending has increased as a share of the total agricultural budget, funding for agriculture from cooperating patterns has declined.

VI. STAPLE FOOD VALUE CHAINS

This section provides background information and suggests possible interventions in several of the key staple food value chains in Zambia: maize, horticulture, groundnuts, cassava, beans, village poultry, and aquaculture.

6.1. Maize Value Chain

6.1.1. *Production: Among All Food Crops Grown by Smallholders in Zambia, Maize Is the Most Important.*

a. General Production Trends

- In 2009/10, 1,212,327 (81.72%) smallholders in Zambia grew maize, more than any other food crop (Figure 30).
- In 2009/10 Zambian smallholders planted 1,182,217 hectares of land in maize, or roughly 51% of the total cultivated land in the country.
 - Thus, successful crop diversification in Zambia requires converting land currently used for maize cultivation to other crops.
- Between 2006-10 maize yields within the smallholder sector averaged 1.54 mt/ha, well below the global average of 4.47 mt/ha.
- Over the same period an average of 45% of smallholder farmers produced 1 mt/ha of maize or less while 72% produced 2 mt/ha or less (Figure 31, following Map 12), with the highest incidence of poor producers located in Western Province and the highest absolute number of poor producers located in Eastern Province (Table 12).

Figure 30. Cumulative Distribution of Household Yield per Planted ha (2006-2010)

Table 12. Distribution of Households Producing 1 mt/ha or Less over Time

Province	Number of households producing 1 mt/ha or less (share)				
	2006	2007	2008	2009	2010
Central	66,146 (0.39)	64,001 (0.36)	85,792 (0.48)	71,300 (0.43)	37,133 (0.21)
Copperbelt	27,234 (0.30)	29,822 (0.35)	27,672 (0.32)	34,420 (0.40)	31,250 (0.29)
Eastern	116,854 (0.40)	167,554 (0.59)	146,750 (0.48)	158,573 (0.48)	89,911 (0.28)
Luapula	20,275 (0.34)	31,759 (0.46)	25,139 (0.33)	35,769 (0.36)	22,511 (0.25)
Lusaka	20,370 (0.43)	17,432 (0.40)	33,379 (0.72)	22,342 (0.50)	12,895 (0.27)
Northern	60,845 (0.40)	61,250 (0.36)	43,104 (0.24)	37,694 (0.21)	26,735 (0.14)
North Western	40,008 (0.40)	56,611 (0.52)	46,288 (0.44)	39,369 (0.42)	28,142 (0.29)
Southern	79,936 (0.38)	116,427 (0.55)	190,926 (0.84)	116,154 (0.47)	82,384 (0.33)
Western	116,422 (0.82)	150,044 (0.87)	156,321 (0.92)	130,014 (0.82)	86,336 (0.60)
Zambia	548,089 (0.43)	694,901 (0.53)	755,370 (0.55)	645,637 (0.46)	417,298 (0.29)

Source: CSO/MACO/FSRP Supplemental Survey various years.

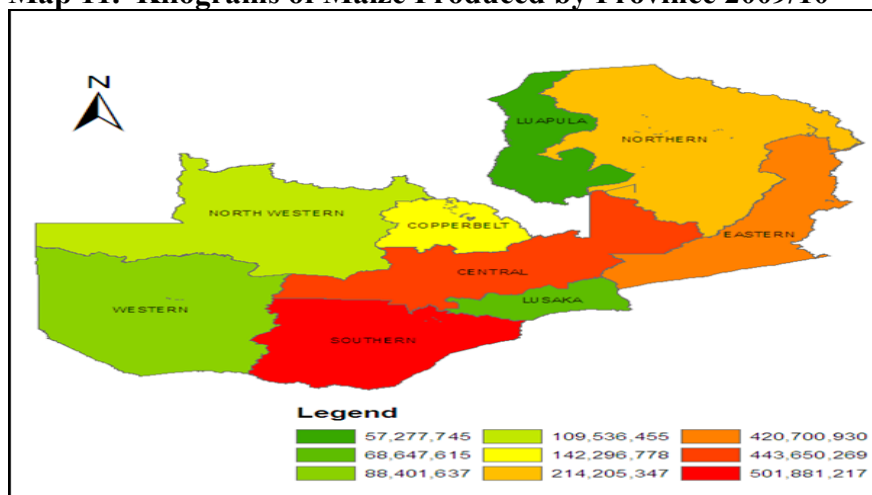

b. Regional Production Dimensions

- 65% of Zambia's maize crop is produced in three provinces: Eastern, Central, and Southern. In 2009/10:
- Central Province: 177,666 (95.11%) smallholders grew maize
- Eastern Province: 295,491 (98.49%) smallholders grew maize
- Southern Province: 185,155 (87.58%) smallholders grew maize (see Map 10)
- Maize growers in these three provinces account for 41.5% of the total smallholder population in Zambia
- While the greatest number of maize producers are located in Eastern Province (Map 10) the greatest quantities of maize are produced in Southern Province (501,881,217 kg Map 11), while the highest degree of commercialization of maize is in Central Province (224,644,792 kg sold, Map 12).

Map 12. Kilograms of Maize Sold by Province 2009/10

Source: CSO/MACO/FSRP Crop Forecast Surveys. 2009/10.

c. Input Access and Use

- Less than 40% of maize farmers in 2009/10 used fertilizer. A higher percentage of farmers in the major maize producing provinces accessed fertilizer than the national average, with the highest concentration of fertilizer users located in Central Province (Figure 31)
- Less than 40% of maize farmers used hybrid maize seeds
 - i. In Eastern Province only 28.81% of farmers used hybrid maize seeds, well below the national average (Figure 32)
- Average yield response to fertilizer in 2010: 1.32 MT/ha
- Both Southern and Eastern Provinces have yield responses below national average (Figure 33)
- Low response due to:
 - i. Use of inappropriate fertilizer mix for particular soil types
 - ii. Late and inappropriate application of fertilizers
 - iii. Low application rate per hectare

Figure 31. Percent of Smallholder Maize Farmers Using Fertilizer over Time

6.1.2. Marketing

Maize is an important cash crop for Zambian smallholders. However, the maize market is characterized by a high degree of concentration and government intervention.

a. Farm Income and Market Behavior

- Maize sales are important for all subsectors of the smallholder population. However, farmers with larger land holdings derive a greater share of their household income from maize sales than those with smaller land holdings (Table 13)
- When including the value of maize retained for home consumption, maize is the most important crop grown by smallholders (Table 14)
- Based on interviews conducted with 1105 commercialized smallholder maize farmers, private sector maize buyers accounted for the bulk of maize purchases in 2009. FRA purchases only accounted for 14% of the total transactions recorded (Table 15)

Table 13. Zambia - Household Shares of Components in Total Crop Sales Income by Landholding Quintiles, National, 2008

b. Market Concentration

- Maze sales within Zambia's smallholder population are highly concentrated, with 2% of producers accounting for 50% of the total maize sales volume in 2008. 36% of smallholders in Zambia are actually net buyers of maize (Figure 34)

Figure 34. Distribution of the Small-Scale Farmer Population According to Their Position in the Staple Grain Market, Zambia

Source: CSO/MACO/FSRP Supplemental Survey 2008.

6.1.3. Consumption/Demand

As the country's staple food, Zambians derive the vast majority of their food calories from maize (57%).

a. Urban Consumption Characteristics

- Across the four major urban centers for which data are available we find that people in the lowest income quintile spend the highest share of their food budget on maize (Table 16)
- Since 1994, the price margin between wholesale maize and retail maize meal prices has steadily declined in real terms (Figure 35). This narrowing of margins has been driven in large part by the rapid expansion of small-scale maize mills.
- The urban poor frequently purchase wholegrain maize in informal retail markets and then pay to have it milled at a small-scale processor. This is considerably cheaper than purchasing refined maize meal produced by large-scale millers. However, as the Figure 36 shows, these retail markets frequently dry up during critical times of the year, which forces urban consumers to turn to higher cost maize meal products to meet their staple food needs.
 - i. In Zambia maize tends to be captured by the large scale milling and grain trading sectors during the marketing season. Once captured there, it tend to only return to retail urban markets in the form of expensive, refined maize meal. Additionally, during national deficit periods imports are channeled disproportionately to the large-scale formal sector, which in essence freezes out the informal retail and small-scale processing sectors that the rural poor depend on for chap maize meal.
- The seasonal nature of maize production, coupled with limited storage, high price volatility, and chronic under-production among some segments of the rural population contribute to recurrent maize scarcities during the months of Dec-Feb (Figure 37)

6.1.4. Research and Development in the Maize Sector

a. Private Sector R/D

- Currently there are nine private seed companies selling maize seed in Zambia, of those three are breeding new varieties in Zambia, three are testing existing varieties for Zambia's conditions, and three are using publicly available germplasm.
- All nine companies multiply seeds in Zambia, but only one uses smallholders to multiply seeds.

b. Public R/D: *Zambian Agricultural Research Institute (ZARI)*

- Two new hybrids: GV 640 and GV 659. Both are medium to late maturing. Yield Potential: 9-10 mt/ha. Nutrition Impact: These hybrids are bred for their high protein content (40-50%).
- Four new OPVs: ZM 521, ZM 621, ZM 421, and Obatamba. Yield Potential: 4-5 mt/ha. Require less fertilizer than hybrids (75kg basal and 75kg urea per ha).

Nutrition impact: All OPVs are bred for high protein content; Obatamba has the highest protein content at 90%.

c. Harvest Plus

- Orange Maize: Biofortified with high levels of pro-vitamin A
 - i. Vitamin A deficiency affects more than half of Zambian children, which contributes to the high rate of growth stunting
 - ii. Orange maize contains 8 milligrams of pro-vitamin A per gram, research is underway to increase this to 10-15 mg/gr
- Late maturing, bred for regions II and III, yet research suggests it also performs well in region I
- Yield Potential: Comparable to the best local hybrids, 8-9.5 mt/ha under good management

6.1.5. Interventions and Investment Opportunities within the Maize Value Chain

a. Making Maize Markets Work for Rural Consumers

- With 36% of rural households being net buyers of maize developing reliable rural consumer food markets is a necessary precondition for the rural poor- particularly for those who do not control sufficient land to produce a marketable surplus of grain yet continue to cultivate grain- to shift their production systems toward higher value food crops without exposing themselves to excessive risk of hunger.
- Improving rural food maize markets will help to limit the number of rural people who are forced to forego meals due to a lack of maize, and thus address the wide disparity in stunting rates between urban and rural Zambians.
 - i. Regional warehouse networks developed under ZAMACE provide an opportunity to meet rural maize needs without incurring redundant transport costs, which currently place upward pressure on rural maize meal prices (i.e. shipping maize out of rural areas to urban processors and then back again to rural areas to meet demand during the hunger months).

b. Supporting Urban Maize Consumers through Improvements in the Informal Retail and Small-scale Processing Sectors

- The urban poor in Zambia spend the greatest share of their staple carbohydrate food budgets on maize. Thus improving the functioning of the maize markets upon which they rely is critical for addressing issues of poverty and malnutrition.
- Growth in the small-scale processing sector is largely responsible for driving decreases in marketing margins between wholesale grain prices and retail maize meal prices (Figure 35).
- The urban poor frequently purchase wholegrain maize in informal retail markets and then pay to have it milled at a small-scale processor. This is considerably cheaper than purchasing refined maize meal produced by large-scale millers. However, as the Figure 36 shows, these retail markets frequently dry up during critical times of the year, which forces urban consumers to turn to higher cost maize meal products to meet their staple food needs.
 - i. In Zambia maize tends to be captured by the large scale milling and grain trading sectors during the marketing season. Once captured there, it tend to only return to retail urban markets in the form of expensive, refined maize meal. Additionally, during national deficit periods imports are channeled disproportionately to the large-scale formal sector, which in essence freezes

out the informal retail and small-scale processing sectors that the rural poor depend on for chap maize meal.

- Working to ensure that maize grain is consistently available in local consumer markets will help to drive down the price paid by consumers for their staple maize meal and promote greater competition between the large and small scale processing sectors, thereby further contributing to the narrowing margin between wholesale maize and retail maize meal prices shown in Figure 35.
- Given the seasonal nature of maize production in Zambia provisioning of local retail markets will require substantial improvements in the incentives to invest in grain storage at the wholesale level of the value chain.

c. *Addressing Maize Productivity Constraints:* In 2010 the average maize yield (MT) per hectare was 2.413. This strikingly low number is actually a significant improvement over previous years and contributed substantially to the record maize harvest recorded in Zambia. Poor maize yields are driven by a number of factors:

- Limited access to inputs. Despite improvements in targeting of subsidized inputs, the majority of small-scale farmers do not have access to inputs.
- Dependence on rain-fed production exposes farmers to significant risk of crop failure due to drought.
- Limited public investment in agricultural research and development:
 - i. Public spending on agricultural research and development has declined from ZK89 billion in 1991 to ZK24 billion in 2001 to ZK20 billion in 2008 (Flaherty and Mwala 2010).
 - ii. Poor extension services for small-scale farmers. A disproportionate percentage of the agricultural budget goes toward *poverty reduction strategies*, namely input subsidies and maize procurement and distribution at the expense of investments in extension services.
 - iii. Successful crop diversification will require a significant portion of land in Zambia to be transitioned from maize to other crops. Yet for this to be feasible, from a political and household food security perspective, maize yields must increase to compensate for population growth and a decrease in area planted with maize. Based on population growth estimates, if Zambia's area dedicated to maize decreases by 3% per year while yields remain constant Zambia will face a deficit of 247,627 mt of maize in 2015 (Figure 38).

Figure 38. Projected Maize Production and Demand to 2015/16 with 0% Annual Yield Increase and 3% Annual Decrease in Land Area Dedicated to Maize

Source: Calculated from FAOSTAT data.

d. Facilitate Regional Maize Trading Opportunities

- Zambia is well situated in the region to effectively exploit existing grain sheds to import and export maize and other agricultural commodities (Map 13)
- Zambia has a ready export market for maize in nearby DRC, as well as Malawi, Zimbabwe, and Tanzania in certain years.
- These markets are essential for supporting producer prices for maize during high production years.
- Import markets that utilize structured trading systems, particularly SAFEX, can serve to set ceiling prices for maize at import parity. Price spikes over import parity are extremely damaging for the poorest of urban consumers
- Facilitating improvements in both policy and infrastructural constraints to regional trade can help to smooth maize price volatility, which is beneficial to producers, traders, millers, and consumers.

Map 13. Grain Marketing Sheds in Eastern and Southern Africa

6.1.6. Policy Challenges in the Maize Value Chain

The primary challenge to enhancing the performance of the maize sector is the unpredictable and discretionary way in which the government continues to intervene in the market.

a. *Tariff and Non-tariff Barriers to Trade*

- Maize imports channeled through the government rarely end up in the hands of the informal retail and small-scale processing sectors, upon which the poor rely, this contributes to the trend highlighted in Figure 24. Supporting reliable access to maize grain within the informal maize trading and small-scale processing sector, particularly during deficit periods, is critical for enhancing the food security of the urban poor.
- Export bans and regulations, enacted in the name of national food security, starve farmers of important regional markets, which are particularly important for supporting producer prices in times of surplus.

b. *Maize Grain Procurement and Distribution by the FRA*

- High FRA buying prices are well above export parity, which undermines Zambia's ability to be a regional breadbasket and stifles private sector involvement in the market.
- Unpredictability of procurement quantities and distribution prices stifle private sector investment in maize markets, including investment in much needed maize storage.
- This unpredictability also undermines the potential development of structured trading systems, such as ZAMACE.

- c. *Input subsidies*
 - Undermines private sector investment in commercial input distribution systems and associated extension services and local research.
- d. *Continued investment in policy research and outreach is therefore critical for highlighting the effects of government interventions in the maize market and to guide policy-makers to make agricultural policy decisions based on empirical evidence.*

6.1.7. Gender Issues in the Maize Value Chain

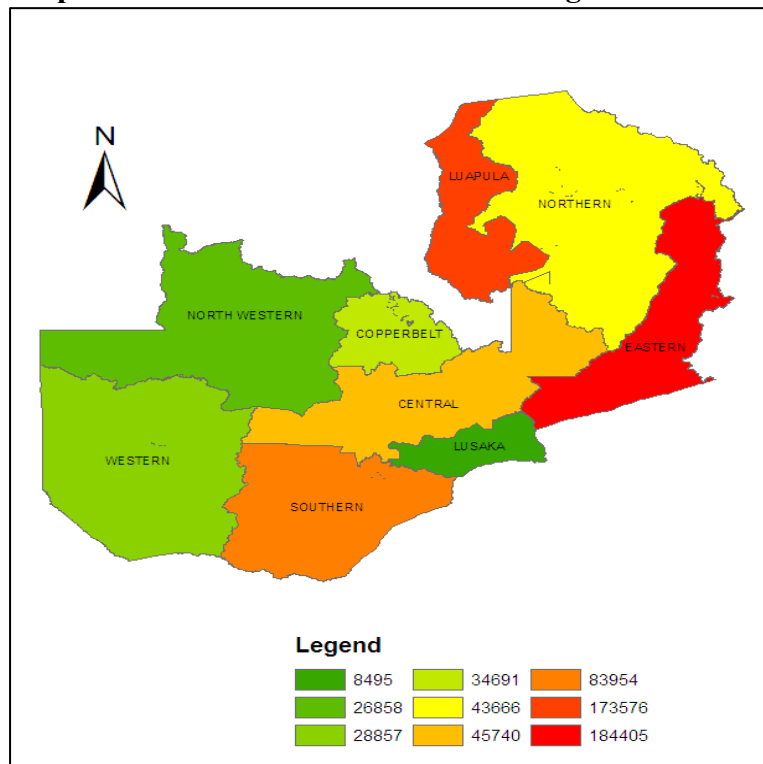

- a. Female headed households control on average 0.5 hectares less land than male headed households.
 - Given the relationship between land size and position within maize markets, women may be disproportionately unable to produce a marketable surplus of maize.
- b. Within agrarian households in Zambia women often do produce their own maize, in addition to the *household* maize supplies produced on their husband's fields. However, women in Zambia are disproportionately saddled with meeting household consumption demands, which may limit their ability to use the maize they produce to generate an income (Farnworth 2010).

6.2. Horticulture Value Chain

6.2.1. Production

- a. In 2009/10 1,230,242 (82.9%) of smallholder farmers in Zambia grew fresh fruits and vegetables (FFV).
- b. Eastern Province recorded the highest number of FFV producers, with 184,405 producing HHs (Map 14).
- c. FFV production is particularly important for households earning less than \$2 per day with 360,986 (30% FFV growers) households. The majority of these are concentrated in Eastern and Luapula Provinces (Figure 39).
 - Vegetable sales make up the greatest share of the farm income from crop sales (roughly 42%) generated among the most land constrained farmers (Table 8).
- d. Of all the FFV produced, 5 crops dominate smallholder production systems accounting for 86% of the total value of FFV sales within the smallholder sector: tomato, rape, cabbage, watermelon, eggplant, and onion (Table 17).
- e. Yields obtained by smallholders for major vegetable products compare favorably with potential yields achieved at research stations, ranging from 55% for cabbage to 82% for onion (Table 18).

^zFigures in parenthesis indicate data obtained in temperate regions under more suitable environmental conditions. ^yEfficiency under local conditions using data from Zambian research data as optimum yield.

f. Issues of Seed Quality and Availability

- Most of the seed is imported as Quality Declared Seed (QDS). QDS is cheaper and thus attractive to importers but the quality is generally poor.
- Conditions during distribution, storage, and retail are not standardized and therefore further compromising seed quality.
- Unlike maize, legislation does not allow for detailed inspection throughout the distribution chain. Seed mixtures and contamination are common and the farmers are not adequately protected.
- There is need to enforce sanitary regulations in the production of Seedlings for prevention of diseases.
- For commodities where seed can be produced locally, investment in seed breeding is needed.

6.2.2. Marketing

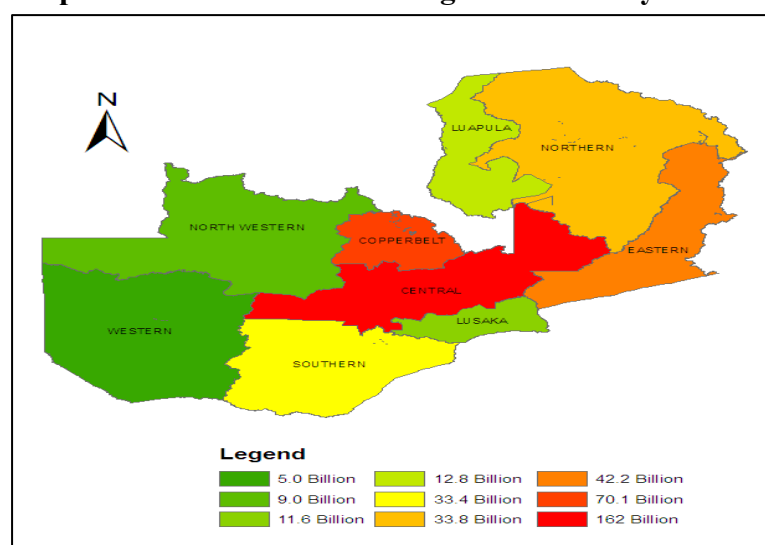

- a. FFV marketing is primarily conducted through informal market channels, which link producers to consumers; most consumers in Zambia acquire their FFV through traditional informal markets rather than modern supermarket chains (Figure 40).
- b. Due to their proximity to urban markets farmers in Central and Copperbelt Provinces achieve the highest value of FFV production in the country (Map 15).
- c. Yet in terms of the percent of total national sales of key vegetables, Southern, Eastern, and Northwestern Provinces are shown to also be important (Table 19).
- d. Soweto market in Lusaka is the primary wholesale market for FFV in Zambia, from Soweto FFVs are sold to local consumers while some are forwarded on to other local and regional markets. The majority of the market's tomato and rape are acquired from surrounding districts, while the majority of onion are imported from South Africa (Maps 16 a, b, and c).

Map 16. A, B, and C. District Shares of Tomato, Rape, and Onion Supplied to Soweto Market, Lusaka

6.2.3. Consumption/Demand

a. Local Demand

- In terms of total food budget expenditures, FFV make up the highest share of urban consumer budgets behind staple cereals, ranging from 15-19% of food budgets in Lusaka, Kitwe, Mansa, and Kasama (Table 20).
- Among all FFV, tomato, rape, and onion make up the greatest share of household food budgets, ranging from 6.9% to 9.4% (Table 21).
- Due to the seasonal nature of FFV production in Zambia prices tend to spike during the rainy season, when crop production decreases, for many important FFV products (Figures 41 a, b, c).

Table 20. Urban Household Expenditure Shares on Food by Urban Area

b. Export Demand

- Zambia Export Growers Association (ZEGA) is the primary export market for Zambian FFV.
- Smallholder exports of FFV are low and tend to be carried out through informal channels, making enumeration difficult. That said, interviews with traders in Soweto market suggest that as much as 31% of tomatoes passing through the market are forwarded on for export to DRC.

6.2.4. Research and Development within the Horticulture Sector

a. Public Sector Research (Tables 22 and 23)

- **Zambia Agricultural Research Institute**
Horticultural programs (Vegetable Research and the Tree and Plantation programs) are part of the eight programs under the Crop Improvement and Agronomy Division within the Zambia Agricultural Research Institute of the Ministry of Agriculture, and Cooperatives (MACO).
- **University of Zambia**
Two units within the University, School of Agricultural Sciences, and the Department of Biological Sciences are involved in agricultural related research that includes horticulture.

Table 22 Major Public Horticultural Research in Zambia

Major Commodity	Core research Focus	Experimental Station
Fruits (Tropical fruits)	Cultivar evaluation/ Introduction Production, Protection Post harvest	NIRS, UNZA SoA Mt Makulu, Mufulira NISIR (Indigenous fruits)
Coffee	Cultivar evaluation/ Introduction Production, Protection	Misamfu

Source UNZA, Crop Science Dept. Research Compendium, ZARI Vegetable Annual Reports (2009, 2010).

b. Private Sector Research

- Seed Companies

The major private sector players in research are Seed companies. However, the majority of seeds are developed and tested overseas.

6.2.5. Interventions and Investments in the Horticulture Sector

a. Addressing the Needs of Small-scale, Informal FFV Producers

This sector comprises the bulk of the small scale horticulture producers. The system is largely informal and disorganized, with production levels generally suboptimal; for most FFV crops smallholder productivity is less than 50 % of the optimum. Furthermore the quality of the produce is of sub standard and not able to be marketed to formal sector processors. For example, tomato total soluble solid content is less than the 4 % that demanded by processors. Critical interventions that are needed to improve include:

- Organizing farmers into groups so that their limitations can be assessed much easily and the assistance can be delivered to large number in a concentrated manner.
- Re organizing the research system to ensure that it is driven by the agenda of the real problems of the growers. This can be done by adopting participatory research and extension methods.
- Facilitating information dissemination system to ensure that the technology development outputs reach the end-users. The recommendations are for other areas and not necessarily based on prevailing socio economic and soil/ climatic conditions.

b. Investments

- Support to extension system recurrent expenditure.
- Optimizing information/ technology delivery.
 - i. Intensive targeted training system (defining training needs and training of trainers); and
 - ii. Logistical support such as transport and other top up remunerations.

6.2.6. Role of Women in FFV Production and Marketing

Women play a major role in the production and marketing of FFV. This is both as a source of labor and as owners of fields. Survey data available, however, does not indicate the gender of the person involved in management or ownership of each of the fields in households. This notwithstanding, women are quite often more involved in the production of vegetables such as okra, African egg plants and the leafy ones such as rape, Chinese cabbage, spinach, and the local traditional leaves. Analysis of the vegetables trade flows and pricing dynamics data of the FSRP shows that 13% of the rape first sellers at Lusaka Soweto market (the main FFV wholesale market) are women compared to 8% and 6% for tomato and onion respectively.

At the wider national level, about 19% of the smallholder farmers that produce FFV and 17% of those that sell are female headed (Figure 42). Women participation in these activities is higher in Lusaka, Western, Northwestern, and Luapula provinces.

Figure 42. Proportion of Female Headed Households Producing and Selling FFV by Province

Source: CSO/MACO/FSRP Supplemental Surveys to the 1999/2000 PHS 2008.

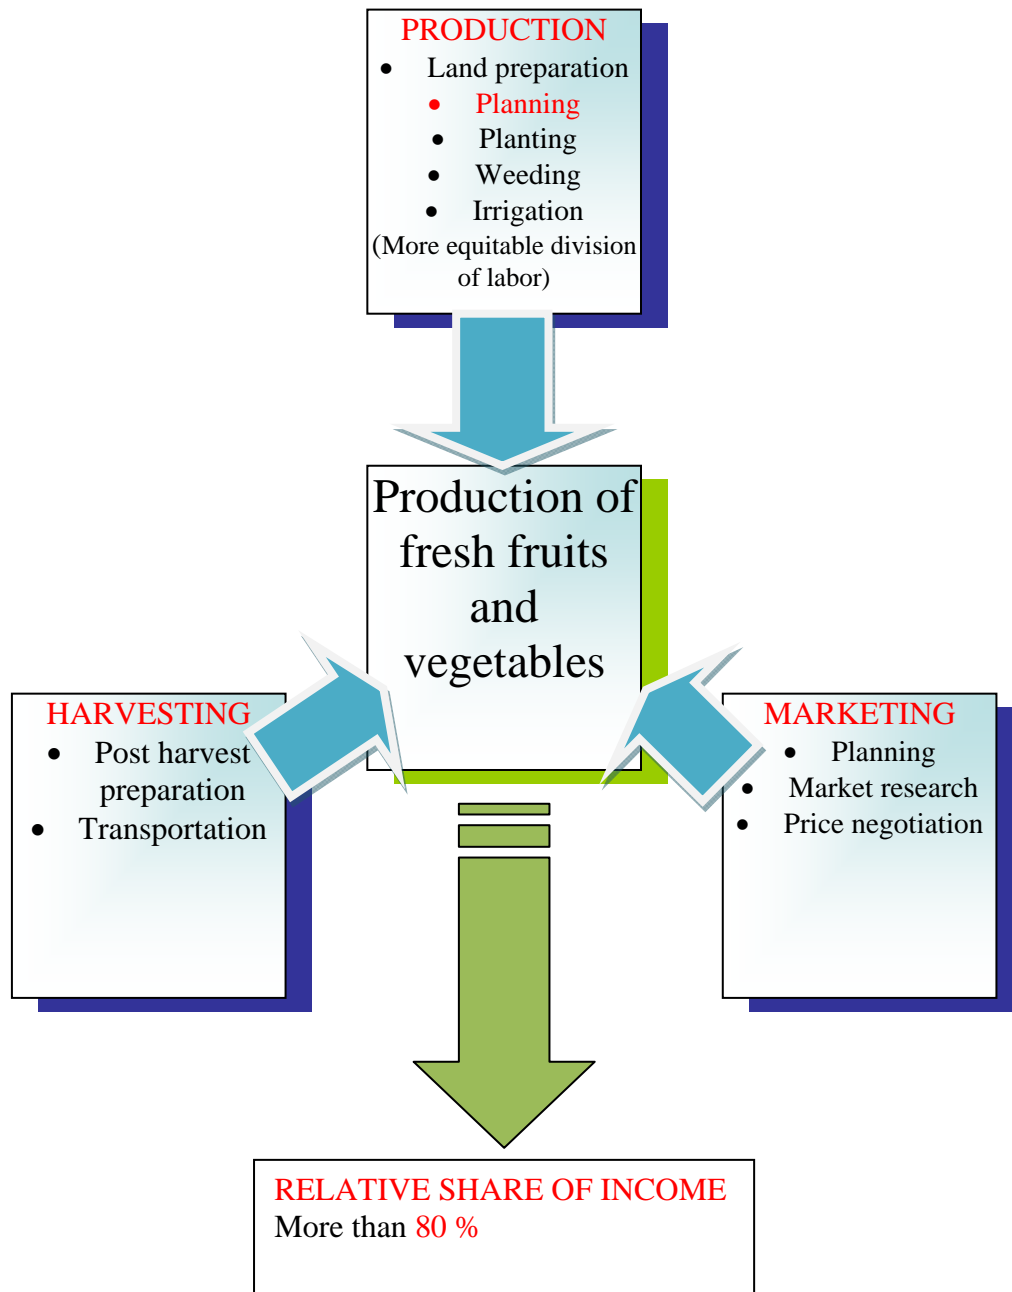

Figures 43 and 44 provide a schematic description of the differential roles played by women in the FFV value chain within male and female-headed households respectively.

Figure 43. Different Roles Played by Women and Children in Horticultural Production: Male Headed Households (The Size of the Arrow Denotes Scale of Involvement)

Figure 44. Different Roles Played by Women and Children in Horticultural Production: Female Headed Households (The Size of the Arrow Denotes Scale of Involvement)

Source: Serageldin 2004.

6.3. Groundnut Value Chain

6.3.1. Production

a. General Trends

- In 2009/10 720,688 (48.58%) households cultivated groundnuts, making it the second most important single food crop grown by Zambian smallholders.
- In 2009/10 Zambian farmers planted 267,578 ha of land in groundnuts.
- Total production of groundnuts in 2009/10 stood at 163,738 mt.
- Groundnut yields in Zambia are low, even by regional standards (Figure 45), averaging .5 mt/ha from 2000-2008. In 2009/10 average yields stood at .731 mt/ha.

b. Regional Production Dimensions

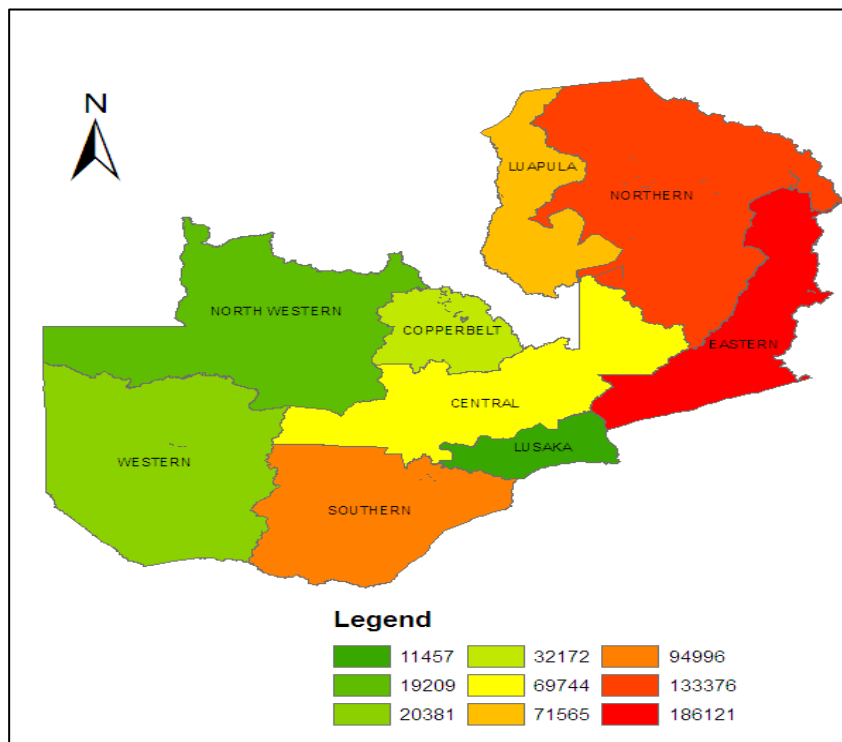

- Groundnut production is concentrated in Eastern and Northern Provinces
- In 2009/10 319,497 hhs in Northern and Eastern Provinces grew groundnuts, which is equivalent to 44% of all groundnut producers in Zambia (Map 17).
- Combined Eastern and Northern provinces accounted for 29.16% of total national production of groundnuts in 2009/10 (47,759 mt) (Map 18).
- In 2009/10 groundnut yields ranged from 661 kg/ha in Central Province to 900 kg/ha in Northwestern. Eastern Province achieved yields below the national average (731) at 670 kg/ha, while Northern outperformed the national average at 832 mt/ha.

Figure 45. Groundnut Yields (mt/ha) in Southern Africa, 2000-2008

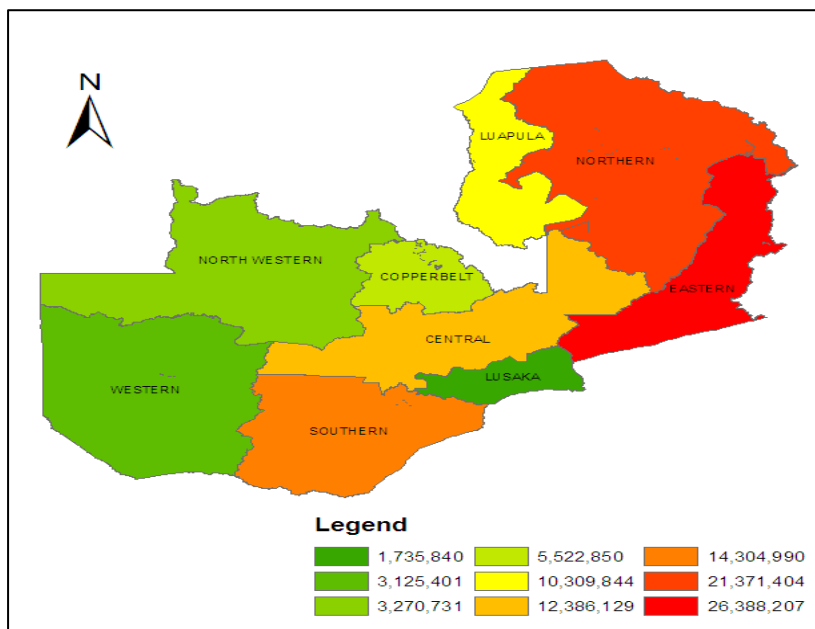

Source: FAOSTAT.

Source: CFS 2009/10.

Map 19. Kilograms of Groundnuts Sold by Province 2009/10

Source: CFS 2009/10

6.3.2. Marketing

a. National Markets

- The majority of groundnuts sold pass through informal market channels.
- 45% of groundnut producers in Zambia sold groundnuts in 2009/10.
- Eastern and Northern Provinces were the most important regions of Zambia in terms of quantities of groundnuts sold (Map 19).

b. Export Markets

- Zambia was once an exporter of groundnuts to Europe. Between 1960 and 1970 the Eastern Province Cooperative Marketing Union (EPCMU) exported over 8000 Mt of groundnuts to the UK.
 - However, concerns over aflatoxins and low quality standards (size and shape of nut) led to a collapse of this market.
- Since 2000 Zambia has oscillated between being a net importer and net exporter of groundnuts (Figure 46). However, trade volumes for groundnuts remain low, not exceeding 2000 mt for imports or exports in a given year.

Figure 46. Import and Export Trends for Groundnuts (mt), 2000-2008

Source: FAO TradeSTAT.

6.3.3. Consumption and Demand

- a. Legume makes up a relatively small component of urban consumers' food expenditure basket, ranging from 3-3.3% of total household food budgets in Lusaka, Kitwe, Mansa, and Kasama (Urban Consumption Survey 2007/08).
 - However, high production levels suggest that groundnuts do form an important part of Zambian diets.
- b. FAOStat estimates current consumption demand for groundnuts in Zambia at 69,964 mt, suggesting a good deal of Zambia's total production is channeled into industrial processes, informally exported, or lost due to spoilage.

6.3.4. Research and Development in the Groundnut Sector

- a. Public Research
 - Research in groundnuts is mainly done at Msekera Research Station Eastern Province.
 - Msekera has released over nine groundnuts varieties in recent years: some are resistant to the common disease, some have high oil content (see Table 24).
- b. Private Research
 - Farmers recycle groundnut seed so private seed companies do not take up seed multiplication of groundnuts in Zambia as it is not a profitable venture.

6.3.5. Women's Roles in Groundnut Value Chain

- a. Female-headed households are actively involved in groundnut production, with 24% of all female headed households growing groundnuts.
 - In Eastern Province 30% of female-headed households grew groundnuts (Figure 47).
- b. In male headed households groundnuts are often gendered as a female crop.

- Women are primarily responsible for the planting, weeding, and harvesting of groundnuts. In terms of marketing, women tend to dominate the small-scale informal groundnut trade in rural and urban markets.

Table 24. Groundnut Varieties in Zambia

Variety	Oil content %	Days to Maturity	Yield (t/ha)	Year Released	Seed size
MGS-2	45-48	130 - 140	1.0 – 2.0	1988	Medium
MGV-4	48-50	120 - 130	1.5 – 3.0	1992	Medium
Makulu Red	48-50	130 - 145	2.0 – 2.5	1964	Small
Champion	48-50	130 - 140	1.5 – 3.0	1998	Large
Chishango	48	130 - 140	1.5 – 4.0	2007	Medium
Luena	48-50	90 - 100	1.0 – 2.0	1998	Small
Chalimbana	48-50	150 - 160	0.5 – 1.0	1966	Large
Natal Common	45-48	90-100	0.5 - 1.0	1976	Small
MGV-5	45-48	130 - 140	1.5 – 4.0	2008	Large
Comet	45-48	90 - 100	0.5 - 1.5	1970	Small
Chipego	48	100 – 110	1.0 - 1.5	1995	Small
Katete	43	90 - 100	1.0 – 2.0	2008	Small

Source: Msekera Research Station.

Figure 47. Female-headed Household Participation in Groundnut Cultivation

Source: CSO/MACO/FSRP 2008.

6.3.6. Investments and Intervention Opportunities in the Groundnut Sector

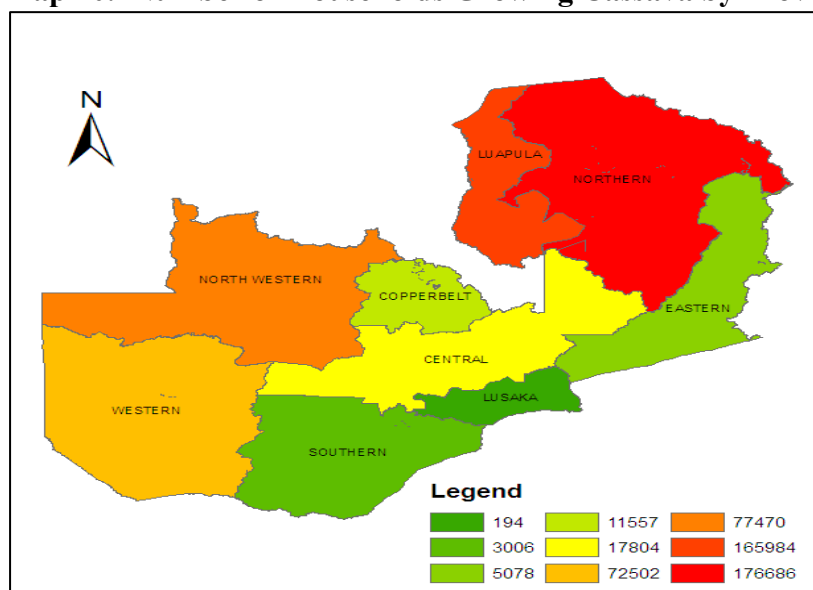

- a. Improve export market potential
 - Requires tackling the issue of aflatoxins. There is need to invest in technologies that can reduce incidences of aflatoxins, e.g. invest in cocoons and improved sacks.
- b. To improve productivity so that the country is price competitive.
 - Train farmers on agronomic aspects: e.g., crop rotation.
 - Promote adoption of improved groundnut varieties.
- c. Promoting outgrowing schemes as the model for groundnuts production. Examples:
 - Former Eastern province Cooperative Marketing Union that used to export groundnuts to the UK in 1960s and 1970s.
 - Then the newly formed Eastern Province Cooperatives Limited, which has 1000 farmers who grow groundnuts and then sale to the cooperative.
 - COMACO, which works with farmers who live in game management areas. It has about 45,000 farmers in its program of which 19,000 are groundnut farmers. It gives groundnuts seed on credit to farmer then it buys the produce.

6.4. Cassava Value Chain

6.4.1. Production

- a. In 2009/10 there were 562,249 cassava producing hhs, making up 37.9% of total smallholder population.
 - Cassava production has a strong regional dimension (Map 20):
 - i. Luapula Province 157,885 producers (92.16%);
 - ii. Northern Province 210,706 producers (80.13%); and
 - iii. Northwest Province 74,618 producers (67.95%).

Map 20. Number of Households Growing Cassava by Province, 2009/10

Source: CFS 2010.

- These three provinces account for 78.8% of all cassava producers in Zambia.
- Since 1965 cassava production in Zambia has grown steadily. This growth has been driven in large measure by the decreasing role of the state in the maize sector since liberalization (Figure 48).
- Cassava yields vary dramatically between producers using traditional cassava varieties (1 mt/ha dry) and improved varieties (2-3.5 mt/ha dry). On farm yields are significantly lower than yields obtained under controlled situations (2 tons traditional 7-11 improved varieties) (Table 25).
- In terms of the production of cassava chips, Zambia produced 421,790,490 kg in 2009/10. 74% (316,268,352 kg) were produced within the three primary cassava producing provinces (Map 21).

Figure 48. Trends in Cassava Production 1965-2005

Source: FAOSTAT.

Table 25. Cassava Yields in Zambia (mt/ha)

	Farm		Research	
	Dry	fresh	Dry	fresh
New cassava Varieties	2-3.5 tons	6-12 tons	7-11 tons	22- 41 tons
Local cassava varieties	1tons	3.5 tons	2 tons	7 tons

Source: Chitundu, Droppelmann, and Haggblade 2006; Simwambana et al. 2004.

Map 21. Kilograms of Cassava Chips Produced by Province 2009/10

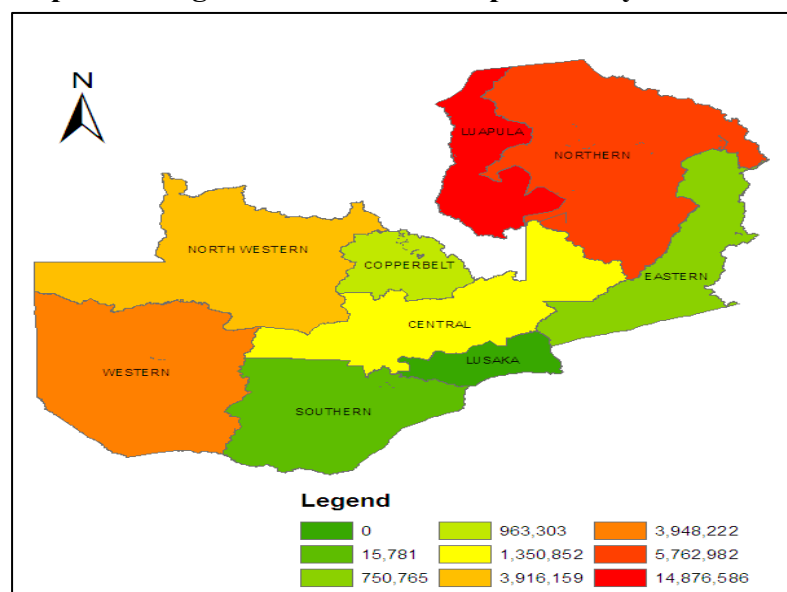

Source: CFS 2009/10.

6.4.2. Marketing

- a. Cassava markets are primarily informal in nature.
- b. Of the 421,790,490 kg of cassava chips produced in Zambia in 2009 only 32,933,502 kg were sold (7.8%), the remained was retained for home consumption (Map 22).
 - Northern Province is the most important province in terms of cassava commercialization.

Map 22. Kilograms of Cassava Chips Sold by Province 2009/10

Source: CFS 2009/10.

- c. Animal feed and other industrial uses of cassava are estimated to be minimal, totaling 1000 mt dry weight.
- d. Formal and informal exports of cassava to DRC and Angola are estimated at 4000 mt dry weight.

6.4.3. *Consumption and Demand*

- a. As a share of total urban food budgets cassava ranks low relative to other staples:
 - Lusaka 0.2%, Kitwe 0.5%, Mansa 3.8%, and Kasama 2.5%.
 - However, for the poorest quintile of consumers in Mansa and Kasama cassava is very important, with cassava purchases absorbing 11.5% and 7.5% of food budgets respectively.
- b. Expansion of industrial processing of cassava and its increased use in animal feeds is projected to drive increased demand for cassava in the future.
- c. Cassava leaves also serve as an important food source in Zambia.

6.4.4. *Research and Development*

- a. Root and Tuber Improvement Programme (RTIP) at Mansa and Solwezi research stations.
 - Released stream of new cassava varieties in 1993 and 2000 after 15 years of research.
 - Research on cassava has stalled because of lack of funding.

6.4.5. *Women's Roles in the Cassava Value Chain*

The low labor intensity of cassava production makes it an important crop for labor constrained female-headed households. In Northern Province 32% of female-headed households grew cassava in 2006/07, while 25% of female-headed households in Luapula Province grew cassava (Figure 49).

6.4.6. *Intervention and Investment Opportunities in the Cassava Sector*

- a. There is need to create demand.
 - Implementation of the CASSAVA STRATEGIC PLAN – Budget of US \$ 11.7million (Donors made pledges: FAO, IFAD, FINNIDA, etc.).
 - Product development by food technology.
- b. To enhance productivity/processing.
 - Continued funding to the research programs.
 - Investing in cheap but durable technologies that can be used at farm level.

Figure 49. Female-Headed Household Participation in Cassava Production

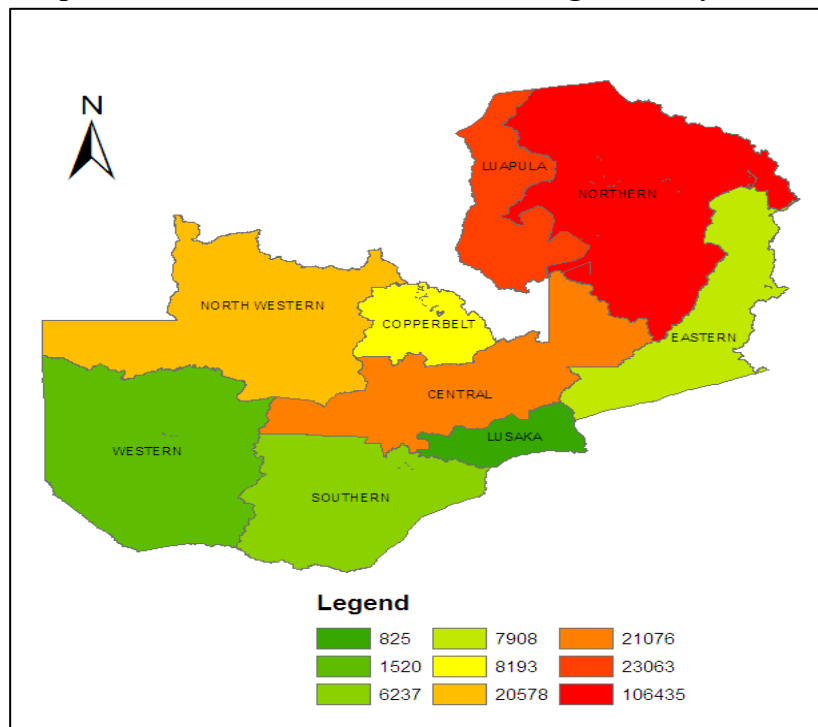

Source: CSO/MACO/FSRP Supplemental Survey 2008.

6.5. Beans Value Chain

6.5.1. Production

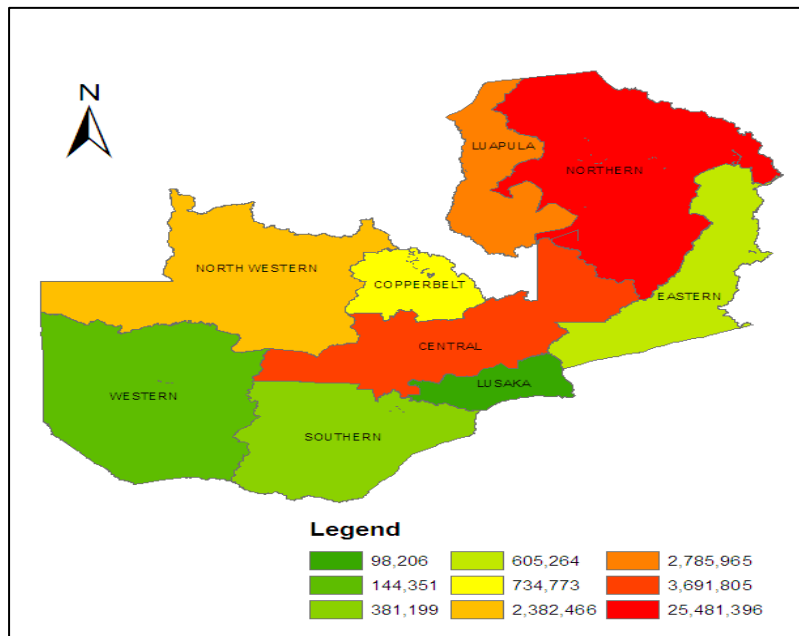

- a. In 2009/10 15.34% (195,835 farmers) of Zambian smallholders produced beans
 - Bean production is highly concentrated in Northern Province where 47.96% of farmers grow beans (106,435). Thus, Northern Province represents 54.3% of all bean producers in Zambia (Map 23).
- b. In 2009/10 83,735 hectares of land were planted in beans, equivalent to an average of .42 hectares per bean producer.
- c. In 2009/10 Zambian farmers produced 95,333 mt of beans representing a 12,000 mt increase over the previous year (Map 24).
 - Bean production in Zambia has grown by 4.7% per annum since 2004 (Figure 50).
- d. Maize yields in 2009/10 stood at 1.1 mt/ha, with Eastern Province recording the highest yields at 5.5 mt/ha (Figure 51).
 - It should be noted that high bean yields in Eastern Province are attributed to the two production cycles per year obtainable in that region.

Map 23. Number of Households Growing Beans by Province 2009/10

Source: CFS 2009/10.

Map 24. Kilograms of Beans Produced by Province 2009/10

Source: CFS 2009/10.

Figure 50. National Bean Production, Export, Import, and Consumption Trends

Source: CFS various year and FAOSTAT.

6.5.2. Marketing

- a. In 2009/10 total bean sales in Zambia were 17,054 mt.
 - 17.8% of total production was sold, the remainder was retained for household consumption.
 - Bean commercialization is highly concentrated in Northern Province, which accounted for 74.5% of all beans sold in Zambia (Map 25).

Figure 51. Average Bean Yields by Province for 2009/10 Cropping Cycle

Source: CFS 2009/10.

- b. Bean marketing is primarily done through informal market channels, for which data is difficult to obtain.
- c. Local Processing is limited but growing, Freshpikt's current market share for baked beans stands at 42.8% and 58.2% for mixed beans.
- d. Formal exports of beans from Zambia are minimal, with just 1493 mt exported in 2009.
 - Limited exports are the result of poor quality standards, the use of inappropriate varieties, high costs of production, and limited market linkages between producers and exporters.
- e. Informal cross border bean trade has been growing at 8.9% per annum over the last four years, with Zambia accounting for 23.4% (2160MT) of the total 9235 MT informal bean cross border exports with the bulk going to DRC, while it imported 1070MT(11.6%) in 2008/09 marketing season (FEWSNET 2009).
- f. In 2009, WFP global purchases of pulses amounted to 188,806 MT, which is 7% of the total purchases of all commodities. However, in 2009 WFP purchased only 237 MT from Zambia (a market share of 0.1%); because of the high price of Zambian beans (US\$ 800/Mt) compared for instance to those sourced from Malawi and Mozambique whose landed cost is US \$ 600/Mt.

6.5.3. Consumption and Demand

- a. Local demand
 - FAOStat estimates current bean consumption in Zambia at 10 kg/capita/yr. Based on current population growth projections demand for beans is expected to rise to 158,000 mt by 2015.

Map 25. Kilograms of Beans Sold by Province 2009/10

Source: CFS 2009/10.

- Freshpitk has put together an ambitious plan to expand its local procurement of beans by 43 % p.a. to 46,000 mt by 2015.

b. Export Demand

- Regional trade statistics indicate 88, 830 Mt of kidney beans being imported in 2008 by five selected countries (South Africa, Zimbabwe, Zambia, Botswana, and Angola) in the region; showing a 31% increase in import volumes from 2004 to 2008.
- South Africa offers an great market opportunity as imports of kidney and navy beans stood at 64,378Mt and 18,000Mt respectively by 2008 (ECIAfrica 2010).
- The majority of current imports come from China, though Zambia could compete favorably given the 10% duty preference it enjoys as a SADC member.

6.5.4. Research and Development

a. Public Sector

- Zambia Agricultural Research Institute (ZARI)
- Golden Valley Research Trust (GART)
- University of Zambia (UNZA)

b. Private Sector: seed companies

c. Bean Research Networks

- National: Zambia Bean Research Network (ZABRN)
- Regional: Southern African Bean Research Network (SABRN)
- Continental: Pan African Bean Research Network (PABRN)

d. New Varieties

- From 1998 to 2009, 15 bean varieties that are resilient to multiple stresses have been released some of which include: Chambeshi (A197), Lukupa (PEF 14), Lyambai (CAL 143), Kalungu (SPS2-4P24), Kabale (KID 31), Kabulangeti, Kapisha (C30 – P20), Lwangenzi (OPS-KW1), Bounty, Cardinal, Speckled ice, PAN 148, PAN 116, PAN 128 and SR3(SCCI,2009).

6.5.5. Role of Women in Bean Value Chain

Although national statistics of the number of bean farmers disaggregated by gender is lacking, it is widely accepted that women play a critical role in bean production and marketing (See Figure 52). Women are actively involved in on farm activities and retailing. The on farm activities are labor intensive yet the share of the total value from the bean value chain that women get is relatively small compared to other key players that perform marketing functions such as bulking, processing, transportation and wholesaling. Therefore it is important to develop and disseminate labor saving technologies that would have an impact on the wellbeing and incomes of women such as conservation farming techniques. It has been suggested that conservation farming could reduce labor for land preparation by 30% and when using herbicides decreases labor demand for weeding by 70%. It is also important that women are linked to supply chains that would increase their share of the total value added to

Figure 52. Role of Women in Bean Value Chain

the bean value chain. Lastly, development agenda for improving bean productivity should target women, as they are key decision makers in bean production.

6.5.6. Investment and Intervention Opportunities

- a. Bean seed multiplication of 3 high yielding improved varieties that are demanded within the Sub Saharan Region: Kabale, Lyambai and Lwageni (canning); by encouraging public private partnerships (research and financial institutions, farmer groups, NGOS and markets) aimed at uplifting the welfare of smallholder farmers.
- b. Transfer of bean production (agronomic, soil, integrated disease, and pest management practices) and post harvest and food processing technologies to farmers through outreach programs.
- c. Linking farmers to sustainable and equitable markets.

6.6. Village Poultry Value Chain

6.6.1. Production

- a. In 2007/08 988,658 (66.6%) small-scale farming households raised chickens, with the highest number of chicken owners located in Eastern Province (Map 26).
- b. The total number of village chickens in Zambia is estimated at 14 million
- c. Village chicken production tends to extremely low input.
 - Village chickens rarely receive vaccinations (particularly for Newcastle disease).
 - Village chickens are rarely given supplemental feed; most are left to scavenge for food.
 - Few are kept in containment facilities.
- d. Though official production figures are lacking, results from research stations suggest that low input village production contributes to low production levels (Bwalya and Mwanguhya 2010).
 - Village chickens take 20-22 weeks to reach maturity compared to 6 weeks for the broiler.
 - Lay 70 eggs per annum (compared to 300 for commercial layer).
 - Egg weight is between 40-42g (120g for commercial layer).
 - Number of eggs brood by the bird 7-18 at a time with a hatchability of 85-90%.
 - 14.55% mortality in chicks has been recorded.

Map 26. Number of Households Raising Chickens by Household

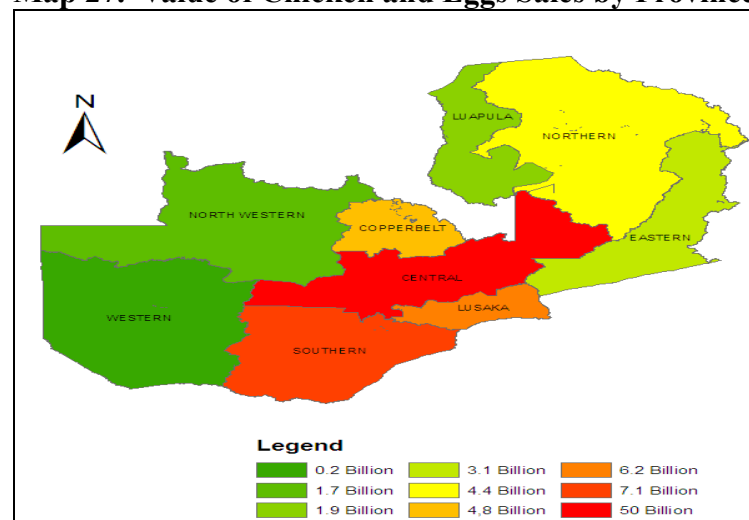

Source: CSO/MACO/FSRP Supplemental Survey 2008.

6.6.2. Marketing

- a. Village chicken markets are highly informal, with most farmers selling small numbers of chickens to meet pressing financial needs.
 - As a result, the use of middlemen to connect farmers to major consumer markets is critical.
- b. In terms of value of poultry products sold by small-scale farmers Central Province is far and away the most important (Map 27). However, this is primarily driven by small-scale broiler chicken operations rather than village chicken sales.

Map 27. Value of Chicken and Eggs Sales by Province, 2007/08

Source: CSO/MACO/FSRP Supplemental Survey 2008.

6.6.3. Consumption/ Demand

- a. Chibolya market in Lusaka is the largest livestock market in the country. It, therefore, provides a proxy for broader marketing trends for the village poultry sector.
 - Village chicken inflow 230-350/day
 - Estimated demand 1500/day
 - Shortfall 1150
 - Wholesale price
 - i. ZMK 20000 hen
 - ii. 25000-30000 cockerel
 - Retail price
 - i. Hen K30000-35000
 - ii. Cock K40000-45000
 - Congo market 25% of chibolya inflows
 - 70% trade through middlemen
 - Only 20% producers sell directly to consumers
 - Main sources of supply
 - i. Central 5%
 - ii. Western 15%
 - iii. Southern 80%
 - Livestock movement ban in Eastern province limits participation
 - 60% of suppliers are females, 50% males
 - 50% female sellers and 50% males
 - Trade is in the open.

6.6.4. Consumption/Demand

Demand for village chickens is difficult to gauge, however based on the rapid expansion of the commercial poultry sector (Since 2000 production of broilers has increased to 28million from 13 million and layers from about 500,000 in the year 2000 to 3 million in 2010), the price differential between broilers and village chickens (roughly 20,000 per bird), and the latent demand at Chibolya market (deficit of birds 1,150) we can assume strong and growing demand for village chickens.

6.6.5. Research and Development

- a. Use of ethno veterinary products, for example Martha Musukwa (UNZA) has been conducting research using moringa plant as a protein supplement as well as a remedy for certain ailments. The idea behind is to reduce cost of feed production as this replaces soya which is an expensive component and to encourage organic farming.
- b. The development of a thermal stable Newcastle vaccine with the view of replacing Lasota a cold chain sensitive vaccine. Trials currently under way in various provinces. This will reduce mortality from the disease and will allow broader coverage even to remote areas with no refrigeration facilities.
- c. Hatchery for local chickens started in Batoka by Gart. If successful this could save as source for day old chicks for village chickens. The hatchery has been made using

local materials to make it sustainable. This in itself will address all the productivity shortfalls addressed earlier.

- d. Research to assess the socioeconomic impact of village chickens done in western province by Dr. Banda and Dr. Simainga as a well of mitigating HIV/AIDS, alleviating poverty, income generation, and nutritional enhancement. This is important in shifting perceptions that cover this noble industry as an inferior venture when compared to the broiler.
- e. Provision of improved layer housing units by some NGOs that are environmentally acceptable and cheaper than the battery cages. Advantage is that the work well for village setup layer production units. This leads to increased production of eggs and allows for easy handling for interventions such as vaccinations.
- f. The Government has set up a number of facilities for research in the Livestock Industry. These include a Ministry of Livestock and Veterinary departments. In addition, agriculture research stations (Mount Makulu, GART, Msekera, etc) are available in most provincial centers and include research in Poultry.
- g. Establishment of VETLAB through the efforts of PAZ with assistance from USAID and other stakeholders (Ross, Hybrid, Zambeef, Agrivet, Golan Poultry Solutions, Nutri Feeds, Olympic Milling, and Bokomo). These laboratory services cover all sectors of livestock and are charged at commercial rates. Feed testing is also done on request from clients.
- h. Infrastructure has expanded by 100% for hatcheries and feed making companies. Broiler production has reached a staggering 28million per year and is expected to rise. The capacity of production is estimated at 1.8million per week but it's yet to be attained. If this is attained it will give 1.8million per week.
- i. The local market is so huge that companies are only allowed to export 10% of their production to avoid shortages.

6.6.6. Role of Women in Village Poultry Value Chain

- a. Women feature prominently in village chicken rearing and marketing. Evidence from Chibolya market suggests that 60% of producers and 50% of retailers are women.

6.6.7. Investment and Intervention Opportunities

- a. *Establishment of Village Chicken Breeding/ Multiplication Centers:* The establishment of such centers would facilitate bulk production of the local chicken and its marketing. The system can use Women's groups for labor as well as marketing. This would result in selection of good breeding stock in the required ratio of cockerel to hen as opposed to current trends where farmers use spent cockerels with a long history of inbreeding.
- b. *Women Capacity Building:* Women need to be empowered with training in management skills, bookkeeping, and value addition activities if the value chain is to be of any significance. This would help them interpret business trends and hedge against risks. They would act from an informed view. In terms of village chickens,

women must be made to appreciate the use of ethno-veterinary products and feed supplementation if the chicken is to be considered organic. Focus should also be attached to veterinary interventions so that losses due to viral diseases are minimized.

- c. *Poultry Certification Systems:* This system would ensure that Poultry products are certified for quality and source. This would also facilitate tracking in case of diseases and other eventualities. This would involve establishment of testing centers and provision of certificates. If many small scale farmers register on the program, their bargaining power for the prime markets such as Shoprite, spar would be strengthened. Intermediate buyers could be organized to provide warehousing facilities for the farmers. This would mean the small scale farmer would stick to his program of all in all out production without incurring extra costs for storage or further feeding. Under this certification system small scale farmers are to be requested and taught how to meet certain minimum standards such as branding and other processes if they are to compete favorably on the market.
- d. *Policy Streamlining:* The introduction of poultry-specific policy would facilitate regulation, training, monitoring as well as general control of the sector. The currently situation where the veterinary department is very strong at HQ and weakest at camp level requires urgent redress. If women farmers in the villages are to be promoted, the camp staff must be equipped with modalities to execute his programs.
- e. *Poultry Support Programs:* The establishment of a program to support small-holder poultry producers would be good. This could include loan facilitating, a sub-contracting arrangement with a guaranteed market which would include a package of chicks, medication, training, and basic management skills. Under this program there should be creation of women friendly markets and not the rough markets they are subjected to now. The infrastructure should have descent facilities like trade area, ablution, etc.

VII. ADDITIONAL VALUE CHAINS

7.1. Aquaculture Value Chain, from World Fish

7.1.1. Rationale: Why Invest in Aquaculture?

- a. *There is strong and growing demand for fish in Zambia and the region – and aquaculture is the main means to meet this demand.* Market demand for fish and fish products is strongly increasing in Zambia and neighboring countries and is projected to increase further with growing populations, urbanization, and economic development in the region. Market prices for fish in Zambia have increased sharply over the past years. While they vary seasonally, in most months these increases have been above average food price increases and have ranged from 4% to over 13% per month in 2008.

Per capita supply of fish in Zambia has fallen from over 11kg p.a. in the 1970s to 6.5kg today. The ‘supply gap’ for maintaining the current level will require a further 10,000mt p.a. by 2015; bringing it back to 10kg will require an additional annual increase of at least 50,000mt by 2015.

Markets for fish are particularly strong in the expanding urban areas in Zambia including Lusaka and the Copperbelt towns, as well as in neighboring Katanga province, DRC and other regional centers. In addition, demand among rural populations is growing, if more scattered.

Capture fisheries, while still providing the bulk of fish supply in the country, have on the whole reached their productive capacity and may decline due to external factors stemming from infrastructure development (dams), land use changes, pollution and climate change.

Aquaculture will be the main means to narrow the ‘supply gap’ of fish in Zambia and the region. While aquaculture currently provides about 8,000mt p.a. (roughly 10% of officially recorded national fish production), there is great scope for broad and rapid growth to meet production targets of at least 50,000mt by 2015 and 100,000mt by 2020. To enable sustainable increases in production and productivity, targeted investments in the aquaculture value chain are required. Initial focus is required on improving input markets (seed, feed), strengthening services to the sector (finance, business development, research/information), and rationalizing the regulatory and policy environment.

- b. *Fish is an important source of high-quality nutrition for the poor in Zambia.* Fish is an important source of high quality nutrition for the poor in Zambia. In addition to providing over 30% of protein, it is often a main source of vital micronutrients. Surveys suggest that fish consumption is particularly important among the poor who can access small and easily divisible quantities of fish. Within households, fish is more equally shared by women, men, children, and the elderly than most other animal-based food.

These benefits can make significant contributions to addressing major malnutrition challenges in Zambia including protein, vitamin, and mineral deficiencies.

Aquaculture can meet the strong demand for fish among the poor very efficiently. Several tilapia species are being farmed in Zambia that are generally well suited for aquaculture expansion and intensification. Managing tilapia production for small size

food fish allows two or three harvests a year in most parts of Zambia and can regularly yield large quantities of fresh fish products for the poor.

There are basically two avenues for delivering food and nutrition security benefits through aquaculture that are relevant in Zambia:

- Smallholder aquaculture among the rural poor for on-farm consumption and local markets, and
- Commercial aquaculture through small and medium scale enterprises that target urban and regional markets.

- c. *Smallholder aquaculture increases incomes and farm productivity and improves nutrition security among the rural poor.* Aquaculture on smallholder farms can be an efficient way to produce highly nutritious food from locally available resources. Fish production levels will be modest but will make significant contributions to household food security and will generate limited surpluses for local marketing.

Integrated Agriculture Aquaculture (IAA) technologies have been shown to improve farm productivity, nutrition security, and incomes among smallholders in Southern Africa. In addition to fish production, fish ponds strengthen productivity and nutrition impacts of mixed farming systems at smallholder level. Water is used for small-scale irrigation during the dry season, allowing continued production of vegetables as well as staple crops. In view of likely climatic changes in Zambia and the region, improved on-farm water management will become increasingly important for securing viable smallholder livelihoods.

Smallholder aquaculture can also provides significant opportunities for households headed by women or children and for families affected by HIV/AIDS. Labor requirements are limited beyond the initial construction and harvesting for food or sale is flexible and can be timed and apportioned to meet specific household needs.

- d. *SME aquaculture generates rural economic growth and provides affordable, highly nutritious food for national and regional markets.* Commercial private investments in aquaculture are growing in Zambia. Currently, about 20-30 aquaculture enterprises in the SME sector are producing fish from ponds and/or cages. These are clustered mainly to supply urban markets in Lusaka and the Copperbelt towns. The number of commercial farms is growing and their scale of operation is expanding (average of 20-30 ponds per enterprise). Government estimates put productivity of these systems to about 5-6 tons (tilapia) per hectare, which suggests semi-intensive production using purchased fingerlings and supplementary feed. Experience from similar production systems elsewhere shows that productivity can be significantly increased (by over 100%) with access to improved seed, feed and production methods.

The high degree of urbanization in Zambia and its position in relation to regional markets provide an accessible, solid, and growing consumer base for SME aquaculture. Specific additional opportunities exist in targeting significant demand among mining populations. Mining companies are starting to invest in aquaculture production through outgrower schemes, which could be profitably managed by SMEs.

Aquaculture SMEs are often the drivers of sector development, stimulating investments in improved input markets and service sectors, which in turn increases productivity and lowers costs of inputs and triggers further investment in fish production. This momentum is starting to show also in Zambia with private sector hatcheries and feed mills increasing their investments. With further targeted support

to critical points in the value chain, Zambia could enter a similar growth curve as is currently witnessed in Uganda (from 5,000mt in 2002 to 51,000mt in 2007) or Nigeria (30,000mt to 85,000mt over the same 5-year period).

Benefits from SME aquaculture include large quantities of highly nutritious food at affordable prices for major population centers, employment opportunities for rural and urban poor through the value chain, and investment opportunities in input value chains, service industry, transport, and marketing.

7.1.2. Opportunities for Investing in Aquaculture in Zambia

Opportunities for investing in aquaculture in Zambia have improved strongly. Driven by increasing demand for fish, also by the poor, the economic context of the sector is strong today. In response, private investments are growing.

The policy and regulatory environment is improving and Government of Zambia has further prioritized aquaculture as a growth sector in the SNDP. Capitalizing on this momentum for change, support can be targeted at updating the institutional framework and specifying policies and regulations to meet the demand of increased investments in sustainable aquaculture production.

Broadly speaking, a two-pronged approach to investing in aquaculture in Zambia is recommended:

- a. Strengthening the aquaculture value chain through SMEs to generate local economic growth and increase fish supply to expanding national and regional markets; and
- b. Enhancing and scaling-up smallholder aquaculture to improve incomes and food and nutrition security among the rural poor and increase productivity and climate resilience of smallholder farming.

This approach responds to specific and complementary opportunities in different socio-economic settings in Zambia and would result in a diversified aquaculture sector contributing to meet the needs of the poor as producers, consumers, and stakeholders in wider agricultural development.

7.1.3. Challenges and Constraints and How they Can Be Addressed

- a. *What are the barriers to adopting aquaculture, why are so few farmers doing it? What sorts of market barriers are there? What sorts of investments could best address these challenges.* Poor smallholders- defined here as those with less than 1 ha land-holdings – are generally only able to build small ponds, not least because transforming substantial areas of crops to fish production can increase vulnerability (markets; weather; etc.). A lack of assets – land, education, money – means that pond productivity must be driven by on-farm wastes, which are usually of poor quality and available only in small quantities. As a result, production is rarely more than a few tens of kg per year. Such smallholders are also poorly connected to markets, both input (seed, feed, affordable credit, technical information) and output (access to areas where fish demand and prices are high). Among other things, for example, this results in partial harvests of bigger fish in order to leave the smaller fish behind, which then breed and generate the seed for the next season. Over several generations this strategy serves to select for poor growing fish, with the result that the strains grown in such

farms often perform worse than those taken directly from the wild. Another effect is that the volumes (and quality, especially sizes) of fish produced by individual poor smallholders are insufficiently attractive to traders to buy.

While there can be good reasons to support this sub-sector (improved nutritional and food security; reduced vulnerability to external shocks [e.g. climate change], an element of a considered national Poverty Relief Support Plan), experience tells us that it can be expensive to support. Investment in the formation of Farmers Organizations, which may then be able to secure seed and feed at competitive prices, market their produce together and develop peer-to-peer sharing of best practices. However, such cooperative action is not always easy to achieve in some cultures. Other models include contract growing, something that is being piloted with some success in at least one place in Zambia.

Investment is needed in the development of profitable technologies appropriate to Zambian conditions and different producer types. Priorities would include the development of productive species and strains, affordable feeds, understanding markets (local; regional; export) and the improvement of value chain performance. Investment in participatory value chain analysis would identify where investment is best targeted. (See tables 26 and 27 for aquaculture production and statistics.)

Table 26. Overview of Aquaculture Production Systems in Zambia

Farming system/category	Key features/locations	Species produced	Productivity and estimated output (mt)	Number of farmers	Key constraints	Issues and potential
Extensive pond aquaculture	Reliant on on-farm and local inputs; large clusters of farmers in Eastern, NW, Northern and Central Provinces	Various local tilapia species	2-3 tons per ha 1,200 mt +	Over 8,500	Seed quality and regular access to seed;	Potential to stabilize production levels and scale-out proven integrated technologies; able to reach vulnerable rural populations in most parts of Zambia;
Semi-intensive or intensive ponds	Purchase seed and feed: (i) semi-intensive – locally; (ii) intensive – nationally; Clusters in Copperbelt, Lusaka and Lower Zambezi	Various local tilapia species; Nile tilapia Nile tilapia preferred by most intensive producers	5-6 tons per ha 2,400mt +	30 (?)	Quality seed; feed quality and price;	Strong potential to increase production with reliable access to improved seed and feed;
Intensive cage culture	Purchase seed and feed nationally; own hatcheries; Clusters in Lake Kariba and Lower Zambezi;	Nile tilapia	7-8 tons per cage (size?) 680mt	9 (?)	Sites; feed; seed; disease(?)	Potential to grow further in specific sites; requires risk management and environmental monitoring;
Small water bodies (dams, reservoirs)	Intermittently stocked and self-seeding; no supplementary feed; Southern Province, Eastern Province	Various local tilapia species; Nile tilapia	0.5 tons per ha 1,700mt +	700 small water bodies	Tenure and access; productivity;	Potential to increase productivity and production through introduction of small cages; tenure and access issues to be resolved;

7.2. Rice Value Chain

7.2.1. Background

Rice has sub-regional comparative advantages in Northern Province Zambia, around Chama, and in Western Province, centered around Mongu, and to a lesser extent Eastern Province (Table 28 and 29). The rice growing regions in Zambia therefore are quite isolated from major urban consumption centers. Given the poor state of Zambia's infrastructure in these regions transfer costs between production areas and consumption centers are high, which drives up the cost of domestically produced rice and limits the profitability of rice production for farmers. (See maps 28 and 29 for rice production.)

In terms of the share of urban food budgets rice is quite low, relative to other staple carbohydrates. However, the proximity of important rice growing regions to Tanzania, where rice is one of the primary staple foods, does provide some regional trade opportunities.

7.3. Cotton Value Chain

7.3.1. Background

The percent of smallholders growing cotton has declined sharply since its peak in 2005/06 (tables 30 and 31). Much of the wide variations in cotton production are the result of poorly developed regulatory frameworks, which contribute to high levels of side selling and *pirate buying*.

Profitable cotton cultivation is highly dependent on access to sufficient land and labor, which are beyond the scope of the poorest and most vulnerable rural people in Zambia. Table 8 shows that, as a share of crop income, traditional cash crops like cotton play a negligible role in the incomes of land constrained smallholders. (See maps 30 and 31 for cotton cultivation.)

VIII. EASTERN PROVINCE DATA

8.1. Population

- a. In 2006, Eastern Province's population was 1,604,257, or 14% of the total population of Zambia (Table 32).
- b. More so than any other province in the country Eastern Province is predominantly rural, with 92% (1,473,253) of the population living in rural households (Table 33).
- c. In 2006, Eastern Province had 320,393 households, 92% (294,761) of which are rural.

8.2. Poverty and Nutrition Data

- a. In Eastern Province, 64% of under-5 children exhibit signs of growth stunting, well above the national average of 54.2%. In terms of absolute numbers, Eastern province has the highest number of children exhibiting signs of growth stunting (115,885) (Table 34).
- b. In Eastern Province, 65.4% of people are considered extremely poor, well above the national average of 50.6%. Due to its high population density, Eastern Province has the greatest number of extremely poor people (1,049,142) of all the provinces (Table 35).

8.3. Cropping and Production Data

- In terms of the percent of farmers growing crops the four most important crops grown in Eastern Province (2009/10) are shown in Table 36.
- Eastern Province is home to 71% of all sunflower growers in Zambia, 80% of all cotton growers, 55% of all tobacco growers, and 23% of all maize growers (Table 37 and Figure 53).

Table 36. Percent of Farmers in Eastern Province Growing Crops, 2009/10

	% of Farmers Growing
Maize	98.49
Groundnuts	69.4
Sunflower	27.74
Cotton	26.96

- c. In terms of area cultivated with particular crops, Eastern Province accounts for 70% of all of Zambia's land that was cultivated with sunflowers in 2009/10, 70% of all cotton land, 49% of all tobacco, and 24% of all maize (Table 38 and Figure 54).
- d. Eastern Province contributes a significant share of the total national production for many crops. For example 73% of the total sunflower production in Zambia came from Eastern, 30% of all groundnuts, 69% of all cotton, and 22% of all maize (Table 39 and Figure 55).

Table 38. Area Cultivated 2009/10

	Eastern	National	Eastern Province's Share of National Total
Maize	286811	1182217	24%

Source: CFS 2009/10

- e. Crop Yields in Eastern Province tend to be at or below national averages. The one exception is beans, which has crop yields that far exceed national and even global averages. Discussions with crop scientists suggest that these high yields result from Eastern province farmers obtaining two harvests of beans per year (Table 40 and Figure 56).

Table 40. Yield (Kg/ha), 2009/10

	Eastern Province	National	Yield Gap (+/-) Relative to National (kg/ha)
Maize	1878	2082	-204
Sunflower	582	557	25
Groundnuts	670	731	-61

8.4. Farm Structure and Size

- 22.56% of all farms in Eastern Province are less than 1 ha in size.
- Eastern Province accounts for 15% of all small (<1 ha) farms in Zambia (Map 32).
- Relative to other high production provinces, Eastern Province has very few (68) large-scale farms (>20 ha). (Table 41).

8.5. Input Use and Access

- In 2009/10 42.54% of smallholders in Eastern province used fertilizer on their crops, above the national average of 38.79% but below other major production areas, such as Central and Copperbelt Provinces (Table 42).
- However, the use of hybrid maize seeds is quite low in Eastern Province relative to national figures. For example in 2009/10 28.81% of farmers in Eastern used hybrid maize seeds compared to a national average of 38.21% (Table 42).

8.6. Crop Sales Data

When including data from large-scale farms, Eastern Province is expected to contribute 12% of all maize sales in Zambia in 2009/10, 24% of all groundnut sales, 3% of sunflower sales, and 15% of all cotton sales (Table 44).

Table 44. Expected Sales (Including Large-scale Farming Sector)

IX. COUNTRY READINESS

This section outlines the medium and long-term policy goals and frameworks guiding agricultural investments in Zambia

9.1. Zambia's Long-Term Development Agenda Is Outlined in the Vision 2030 Document

- a. Vision 2030 is a long-term economic development strategy, which is operationalized through medium term five year National Development Plans.
- b. The Vision highlights three scenarios outlining development options, namely the baseline, the preferred, and the optimistic. The socio-economic development objectives enshrined in the Preferred Scenario are: to attain and sustain annual real growth of 6% (2006-2010), 8% (2011-2015), 9% (2016-2020), and 10% between 2021 and 2030; to attain and maintain a moderate inflation rate of 5%; to reduce national poverty head count to less than 20% of the population; to reduce income inequalities measured by a Gini coefficient of less than 40; to provide secure access to safe potable water sources and improved sanitation facilities to 100% of the population in both urban and rural areas; to attain education for all; and, to provide equitable access to quality health care to all by 2030.
- c. Given that the majority of Zambians depend on the agricultural sector for their livelihoods, GRZ, through the Vision 2030, has identified the agricultural sector as key in leading the country's overall economic development strategy.

9.2. Current National Development Plan: Fifth National Development Plan

- a. Agriculture Sector Goals:
 - i. Attain 90% HH food security by 2015;
 - ii. Increase agriculture's contribution to FOREX earnings from 3-5% to 10-20%;
 - iii. Increase agricultural export output at an annual rate of 20%;
 - iv. Grow agriculture from 1% to 7-10% per annum from 2006 onwards;
 - v. Increase agriculture's contribution to GDP from 18-20% to 25%;
 - vi. Facilitate the role of private sector; and
 - vii. Increase incomes for those in agriculture.

9.2.1. The Sixth National Development Plan

The Sixth National Development Plan (SNDP) is currently being formulated and will take effect in December 2010. The SNDP's agricultural section will enshrine the CAADP principles outlined in the National CAADP compact (which has been formulated but not yet signed).

In Zambia's CAADP Compact, three challenges to agriculture as an engine of economic and social development are identified:

- Low investment in the agricultural sector by government and the private sector, despite the sector's support to the livelihoods of over 60% of the population;
- Low production and productivity, especially among smallholder farmers due to low input use and low levels of technology; and

- Failure to fully recognize that chronic hunger and malnutrition are a critical threat to Zambia's long-term development and its 2030 vision.

To address these challenges, the GRZ has outlined specific investment programs, which fall under the four CAADP pillars.

Pillar 1: Extending the area under sustainable land management and reliable water control systems through:

- a) Agricultural Productivity Improvement Programme.
 - Crop and soil productivity enhancement;
 - Irrigation;
 - Livestock production; and
 - Agricultural finance innovations – i.e. leasing, futures markets, insurance, etc.

Pillar 2: Improving rural infrastructure and trade-related capacities for market access:

- a) Agricultural Marketing Development Program.
 - Agricultural market information;
 - Agricultural marketing and trade - Promote structured markets, price discovery and transparency through support to ZAMACE;
 - Private sector capacity building;
 - Rural market infrastructure development - feeder roads, private sector, public access storage;
 - Private sector agro-dealer promotion; and
 - Restructuring of Fertilizer Support Program - E-voucher pilot and build out, more effective targeting.
- b) Agricultural Investment Promotion Program:
 - Electronic voucher for farm input subsidy programs;
 - Investment identification and promotion (including value chain analysis);
 - Investment fund (public/private capital investment);
 - Farm block development;
 - Irrigation development;
 - Out-grower promotion; and
 - Agro-processing promotion.

Pillar 3: Increasing food supply, reducing hunger, and improving responses to food emergency crises:

- a) Food and Nutrition Security Program.
 - Social protection and safety nets - investigate and implement alternative delivery mechanisms that crowd in private sector;
 - Food security pack;
 - Early warning;
 - Agricultural information and statistics;
 - Nutrition research and education;
 - Livestock; and
 - Fisheries.

Pillar 4: Improving agricultural research, technology dissemination, and adoption:

- a) Research and Extension Enhancement Program.
 - Consultation-based research and extension agenda;
 - Research and extension infrastructure improvements;
 - Human resources development;

- Support to private sector research; and
- Information communication technology.

9.3. Several Supporting Policies Have Been Promulgated in Order to Support the Functioning of Zambia's Agricultural Markets

9.3.1. Agricultural Credit Act

- Appoint agency to regulate warehouse receipt system (WRS).
- Improve inventory credit by issuing transferable receipts.

9.3.2. Agricultural Marketing Act, Which Seeks to:

- Provide for a comprehensive & trade enhancing agricultural marketing legislation;
- Realign Government regulatory and market support functions;
- Identify new strategic roles of the FRA;
- Harmonize and consolidate existing agricultural marketing related Acts;
- Provide for a comprehensive & trade enhancing agricultural marketing legislation;
- Realign Government regulatory and market support functions;
- Identify new strategic roles of the FRA; and
- Harmonize and consolidate existing agricultural marketing related Acts.
