The ethanol boom has generated an unprecedented amount of industrial investment in many rural communities. However, local governments and economic developers have little reliable information regarding the economic impact of these plants in the community. An assortment of consultants and government agencies, including some universities, has produced a wide range of positive impacts that stretch beyond sound economic theory or method. Communities using these optimistic estimates risk investing scarce tax dollars and resources into ethanol projects that may not produce the full expected economic benefits. Thus, it is worth discussing a reasonable estimate of the likely economic impact of a 100 million-gallon-per-year (MGY) ethanol plant in a rural Nebraska county.

The first step is to estimate future revenues and costs of a typical ethanol plant. This scenario assumes that all ethanol tax credits are extended and that the corn-based ethanol fuel mandate is increased to 15 billion gallons a year, which keeps ethanol prices around \$1.80 per gallon and corn prices around \$3.30 per bushel. This generates healthy profits for the ethanol plant over the coming decade, with gross profits ranging from \$0.06 to \$0.10 per gallon of ethanol produced. In terms of direct economic impacts, the operation of a 100-MGY ethanol plant creates 45 new jobs and \$21.15 million in value added economic activity to the county economy. In addition, an increased corn price for local farmers adds another 5 jobs and \$215,400 in economic activity to the local economy. This direct impact also creates a spin-off effect caused by the spending of the ethanol plant and its workers in the local economy.

Indirect, or business-to-business impacts, are goods and services purchased by the ethanol plant from other businesses in the county. These transactions add 74 jobs and \$8.15 million in value added economic activity to the

local economy. Indirect effects would create business opportunities in transportation and warehousing, public electric utilities, waste management services, administrative services and repair and maintenance services.

Induced, or business-to-household impacts, are goods and services purchased by households that have one or more members employed at the ethanol plant or in the indirect support industries. These transactions add 45 jobs and \$2.19 million in value added economic activity to the county economy. Induced effects would create business opportunities in health care, retail trade, food services and miscellaneous other services.

The total impact of a 100-MGY ethanol plant, including both direct and spin-off effects, adds 168 new jobs and generates \$31.70 million in new value added economic activity to the local economy. This is a sizable impact in most rural counties in Nebraska. One new job at the ethanol plant creates an additional 2.73 jobs in the county (job multiplier of 3.73); and one new dollar of value added generates an additional \$0.50 in economic activity in the local economy (value added multiplier of 1.50). The jobs multiplier is much higher because it includes industries that employ many part-time workers, and many of these new jobs pay lower wages.

In terms of tax revenues, a 100-MGY ethanol plant generates \$3.28 million in state tax revenues and \$2.78 million in local tax revenues. Local tax revenues are shared among cities, K-12 schools, county government and

other taxing jurisdictions. It is important to note that these are gross revenue estimates that do not count government costs. The costs of any tax subsidies, or the costs of expanded government services (such as utilities, roads and schools) should be deducted from these tax revenue totals.

In summary, ethanol production will continue to contribute to rural economic development so long as government subsidies and expanded renewable fuel mandates stay in place. The ethanol industry provides good-paying jobs and contributes to increased farm income in rural communities. Ethanol production generates additional local jobs in other industries that supply the plant and service its workers. The capital-intensive nature of ethanol production results in sizable state and local tax revenues, so long as there are no locally-funded tax incentives and minimal demands on public services. In short, ethanol production is an important part of a community's industrial and agricultural portfolio. However, economic impacts work both ways. Rising corn costs and falling ethanol prices may mean that some ethanol plants might be idled or go bankrupt in the coming years. If this scenario were to materialize, it would mean the loss of these new jobs and added tax revenues.
