Agriculture Information Bulletin No. 230
Revised August 1966

U. S. DEPARTMENT OF AGRICULTURE

NEG. ERS 133-65 (11) ECONOMIC RESEARCH SERVICE

Figure 1

PREFACE

This annual report contains summary estimates of costs and returns for 1965 and earlier years on 42 important types of commercial farms in 24 major farming areas in the United States, together with a brief analysis of changes that have occurred in production, prices, income, and costs for each of these types of farms. This is the 20th annual report.

Since 1964, minor revisions have been made in certain estimates for a few of the farm series because of improved data or more current information.

As a consequence of enumerative field surveys and further study of census questionnaires, fairly extensive revisions were made in two statistical series--the cash grain farms in the Corn Belt and the wheat-corn-livestock farms in the Northern Plains. For the most part, the general overall characteristics of these farms were not changed. However, both the grain and livestock enterprises have been enlarged slightly to more adequately represent changes that have taken place on these types of farms.

Estimates for earlier years are reported in USDA Statistical Bulletins 297 and 368. Concepts and procedures are discussed briefly in Statistical Bulletin 368. Additional information is available for 1964 and 1965 for each of the major groups of farms in the Farm Costs and Returns (FCR) Series, Nos. 36 through 44, published by the Economic Research Service.

Data in these reports represent results of operations on typical or representative farms of the specified type and size. In all instances, the typical farms are important operating units in the specified area, and in most instances they are the most common units.

For example, of the approximately 30,000 farms in western Wisconsin (see map on page ii), about 83 percent were classified in the 1959 census as commercial farms, and 84 percent of these were dairy farms. According

to a recent survey, 75 percent of the dairy farm operators sold grade-B milk (for manufacturing purposes). Typical commercial family-operated dairy farms in this area have 20 to 25 milk cows and heifers, 2 years old and over. They are by far the most common type and size of farm in the area and probably constitute 70 percent of the dairy farms producing grade-B milk in Western Wisconsin.

In contrast, there are several different types of farms in the hog-beef fattening area of the Corn Belt. Beef fattening farms are probably the most common, but they vary considerably in size and method of operation. Some operators fatten hundreds of animals a year, mostly with purchased feed; other operators grow nearly all the feed for the 50 to 60 head they fatten each year.

In 1965, the typical hog-beef fattening farms represented here cultivated an average of 130 acres of feed grains, farrowed about 38 sows, and in the fall bought 80 to 95 feeder cattle of approximately the same age and size as the cattle they raised from their own cows. The cattle were to be fattened and sold early the next fall. Although this is a common operation, results may or may not be representative of some other beef fattening farms.

Data in this report supplement estimates of aggregate income and expenses for all farms in the United States, as reported quarterly and annually by the Department, and those reported by various experiment stations and related research groups. Estimates for more types and sizes of farms would be required for expansion to regional and national totals.

The same general procedure, methodology, and terms are used for all types of farms. Thus, these annual publications provide a continuing source of information and a measure of year-to-year changes in farm size, farm organization, technology, investment, prices, costs, and returns on several important types of commercial farms.

For comparability of results among types of farms in these series, all farms are considered to be owner-operated units. Net farm income is the return to the operator and members of his family for their management and labor on the farm, and return to total farm capital. To obtain an estimate of return to operator and family labor, an estimated charge is made for capital. It should be noted, however, that a charge for capital represents a return to the owner of the capital, which in many cases is largely the farm operator.

Any charge for capital on a group of farms must be arbitrary. Farm assets vary greatly in kind, and are purchased at different times; a farmer buys a new machine or some livestock, for example, or decides to add to his farm acreage. Most farmers and ranchers make new investments each year. Some farm assets have a ready market, while others may be disposed of only at a sacrifice. Thus, it is difficult to determine a correct and valid charge for farm capital.

In this report, two alternative capital charges have been made. The first is obtained by multiplying total capital invested in the farm business, regardless of ownership, by the current interest rate in effect January 1 for new loans by the Federal land bank in the respective area. In 1965, this rate was 5.5 percent in 9 districts, 6.0 percent in 2 districts, and midway between in 1 district. From 1930 to 1965, the rate varied from 4 percent to 6 percent.

The second estimate of capital charge is obtained by multiplying total investment in the farm business January 1, again irrespective of ownership, by 4.1 percent. This is the average rate paid by farmers on outstanding debts held by Federal land banks from 1940 to 1960. In this 21-year period, the rate varied from 3.5 percent to 4.6 percent; in 11 of the 21 years, it was 4.1 percent.

Whichever method is used, a further charge is added for production credit on farms where applicable. Such a charge was made on 26 of the 42 typical farms. Mainly, these were

farms on which sales were seasonal. Production credit is calculated at short-term interest rates charged by production credit associations on loans outstanding.

The major sources of data for these costs and returns series are: (1) the U.S. Census of Agriculture, (2) rural carrier and mailed questionnaires sent to farmers and dealers by the Agricultural Estimates Division, Statistical Reporting Service, USDA, (3) enumerative field surveys, and (4) research results and related data from State experiment stations and Federal agencies when data for individual farms are available or when group data meet the specifications for farms by type, size, and location. Data for individual farms of a particular type and size are generally used. Local area data on production rates, prices, and related items are used when they do not differ significantly by type and size of farm.

Many factors need to be considered in composing the different types of farms and in comparing typical farm data with national averages and averages for specific areas. Returns in 1965, compared with those for earlier years, reflect adjustment by farmers on specified farms to meet changing physical and economic conditions. Weather also has an important role in determining farm income. Year-to-year changes in weather tend to produce corresponding changes in crop production, and these changes in turn affect livestock production and farm expenses and income. Farm size, intensity of land use, average investment per farm, and the proportions invested in real estate, machinery, and livestock vary among types of farms and considerably affect farm incomes.

This report was prepared in the Farm Production Economics Division, Economic Research Service, by Wylie D. Goodsell, Erling Hole, Edgar B. Hurd, David Mateyka, Paul Rosenberry, Owen K. Shugars, Edwin G. Strand, and Isabel Jenkins.

John H. Bondurant, University of Kentucky, cooperated in preparing estimates for the tobacco-livestock farms in the Bluegrass

area of Kentucky. James R. Gray, New Mexico State University, cooperated in preparing estimates for the livestock ranches in the Southwestern and Northern Plains areas. R. G. Latimer, Rutgers University, coop-

erated in preparing estimates for the egg-producing farms in New Jersey. Frank D. Reed, University of Maine, cooperated in preparing estimates for the broiler farms in Maine.

FARM COSTS AND RETURNS: COMMERCIAL FARMS BY TYPE, SIZE, AND LOCATION

IN GENERAL

Net Farm Income Changes on Typical Farms

In 1965 net farm incomes averaged higher than in 1964 on 31 of 42 important types of commercial farms in 24 major farming areas of the United States (fig. 1). Net farm incomes were lower than in 1964 on 9 types of farms and about the same in both years on 2 types. Increases in net farm income ranged from 1 percent to 425 percent while declines varied from 4 percent to 24 percent. Both the largest increase in returns and the largest decline occurred on cotton farms. Net farm income per farm on nonirrigated cotton farms in the High Plains of Texas advanced from \$1,877 in 1964, a year of extreme drought in this area, to \$9,857 in 1965. On large cotton-general crop farms in the San Joaquin Valley of California, net farm income declined from \$100,141 in 1964 to \$75,920 in 1965 (tables 1, 2, and 3).

Increases in income from 1964 to 1965 were often substantial. Of the 31 farm types with higher incomes in 1965, more than half showed increases of 25 percent or more. Only 3 of the 31 farm types showed gains of less than 10 percent. On the other hand, only 2 of the 9 farm types with lower incomes in 1965 showed declines of more than 20 percent.

The major factors contributing to higher incomes in 1965 were increases in farm production and in prices received for farm products

sold. All of the farm types that had higher incomes in 1965, except wheat-fallow farms in the Pacific Northwest, showed increases either in net farm production or in prices received or both (tables 4 and 5). On the wheat-fallow farms net farm production declined slightly and prices received averaged about the same in 1964 and 1965. However, higher Government payments for participating in specified farm programs in 1965 offset reduced production and incomes averaged slightly above those of 1964.

Net farm production was lower in 1965 than in 1964 on all 9 types of farms on which incomes declined. On 5 of these 9 farm types lower production was combined with lower prices received for products sold. These 5 were: cotton farms in the Southern Piedmont, small and large-scale cotton farms in the Mississippi Delta, and the medium and large cotton-general crop farms in the San Joaquin Valley of California.

The largest declines in production in 1965 occurred on tobacco and tobacco-cotton farms in the Coastal Plain of North Carolina. On these farms the acreage planted in tobacco was substantially below that of a year earlier. Prices received for tobacco advanced in 1965 but not sufficiently to offset the lower production. Net farm income declined 18 to 22 percent. Prices received in 1965 also averaged higher on Eastern Wisconsin grade-A and grade-B dairy farms but production was down and incomes declined.

¹ Preliminary. ² Revised.

Note: Information presented here is on an owner-operator basis primarily for comparability between types of farms. Net farm income is the return to operator and unpaid members of the family for their labor and management on the farm and return to total capital. No allowance has been made for payment of rent, interest, or mortgage.

¹ Preliminary. ² Revised. ³ Includes cropper labor.

Prices received advanced strongly in 1965 on farm types with major livestock enterprises, particularly on those where hogs, feeder calves, and lambs were important. Prices received averaged substantially higher than in 1964 on cotton-specialty crop farms in the San Joaquin Valley of California. Potatoes are an important crop on these farms and potato prices were up 32 percent in 1965.

Prices paid for goods and services used in production averaged higher in 1965 than a year earlier on 34 of the 42 types of farms. They declined on 7 types and were virtually unchanged on 1 type. Prices paid averaged higher in 1965 on all 9 of the farm types where incomes declined.

In 1965 operating expenses advanced from those of the previous year on 33 of the 42 types of farms. Expenses declined on 6 and were not significantly different in the 2 years on 3 types of farms. Operating expenses respond to changes in quantities of inputs used as well as to changes in prices paid for inputs. Expenses advanced in 1965 on 4 of 7 farm types where prices paid averaged lower than in 1964. Operating expenses on these 4 types averaged from 7 to 19 percent above 1964 levels. However, net farm incomes ranged from 19 to 76 percent above those of 1964.

Although operating expenses were higher in 1965 on most of the farm types, increases in production and in prices received for products sold on many farms offset the higher costs. For example, of the 33 types of farms with higher expenses in 1965, 25 also had higher incomes. On 19 of these farms, operating expenses per unit of production declined from 1 to 80 percent and on

about half of these the decline was greater than 10 percent (table 6).

Operating expense per unit of production was greater in 1965 than a year earlier on all of the 9 types of farms with lower incomes in 1965. Prices paid in 1965 by operators of these farms ranged from 2 to 4 percent above those of 1964. Changes in quantities of inputs used varied from 2 percent more to 11 percent less than in 1964. But net farm production was down from 1 to 24 percent on these 9 types of farms.

Production efficiency (production per unit of input, table 7) has increased during the last 10 years on all the groups of farms studied. The increase from 1951-55 to 1961-65 ranged from around 3 percent on cotton-specialty crop farms in the San Joaquin Valley of California to 57 percent on wheat-corn-livestock farms in the Northern Plains. By groups of farms, the largest increases in production efficiency came on spring wheat farms and broiler farms. In general, the smallest increases came on tobacco farms, particularly the tobacco-livestock and dairy farms in the Kentucky Bluegrass area and wheat farms in the Far West. But there is considerable variation between farm types in the same general area. Year-to-year variations in production efficiency as measured by production per unit of input are great.

On 40 of the 42 types of farms, net farm incomes in 1965 were above the average of 1951-60. The two exceptions were large cotton-general crop farms in the San Joaquin Valley of California, 5 percent below the 1951-60 average, and cattle ranches in the Intermountain Region, 3 percent below the average. Incomes in 1965 on 8

¹ Preliminary. ² Revised.

of the 42 types of farms were double or more than double the 1951-60 average. Four of the 8 were wheat farms, 2 were livestock farms in the Corn Belt, and 2 were cotton farms, one in Texas and one in the Southeast. On all but 7 of the types of farms studied, incomes were 20 percent or more above the 1951-60 level; on 17 of the 42 types, incomes were up more than 50 percent from the average of the earlier period.

Another common summary measure of income from farming is return to investment. This measure is not indicative of the level of farm income because a low return on a large investment might yield a relatively high income compared with a high return on a small investment. However, such a measure does exhibit a rate of return which may be compared with alternative uses of capital. For 1963-65, the return per \$100 invested, with operator and unpaid family labor valued at wage rates paid to hired labor, varied from -\$3.10 on egg-producing farms in New Jersey to \$18.08 on peanut-cotton farms in the Southern Coastal Plain (table 8). In 1963-65 the return per \$100 invested was above \$6.00 on 17 of the 42 types of farms. The return was less than \$5.00 on 19 types and was negative on 4 of these 19. These 4 farms also showed negative returns in 1956-60; 3 of them had negative returns in 1951-55 as well. A negative return to investment means that net farm income is not enough to cover the operator's labor and unpaid family labor at wage rates paid for hired labor.

Net Farm Income Changes on All U.S. Farms

Total aggregate net farm income (including net change in inventory)

for all farms in the United States was about \$14.4 billion in 1965, \$2.3 billion above 1964. Total net farm income per farm averaged \$4,280 in 1965, a gain of nearly 23 percent from the 1964 average (fig. 2). The number of farms in the United States declined 3 percent from 1964 to 1965 while total net farm income increased more than 19 percent.

Realized gross farm income in 1965 at \$44.4 billion was a record high, exceeding the 1964 figure by about 5 1/2 percent. This increase was due mainly to substantially higher cash receipts from livestock product marketings. Receipts from crop marketings were about the same in both 1964 and 1965.

Receipts from marketings of livestock and livestock products were estimated at \$21.8 billion in 1965, an increase of about \$2 billion from a year earlier. Receipts from cattle and calves rose \$1.1 billion due to 11 percent higher prices and a small increase in volume marketed. Hog slaughter declined about 10 percent in 1965 but prices averaged 40 percent higher and marketing receipts were up about \$700 million from 1964. Receipts from dairy products were up about \$75 million in 1965, due mainly to an increase in the wholesale price of milk. There was a sizable increase in marketings of poultry meats in 1965 and prices for broilers and turkeys were higher, leading to an increase of nearly \$200 million in cash receipts.

Receipts from crop marketings were estimated at \$17.1 billion in 1965, about the same as a year earlier. Receipts from wheat, cotton, and tobacco were lower than in 1964 while feed crop receipts totaled about the same in both years. Receipts from oil-bearing crops and vegetables were higher in 1965.

¹ Revised.

Figure 2

Figure 3

Higher Government payments under the wheat, feed grain, and cotton programs supplemented the incomes of the producers of these respective crops.

Wheat marketing receipts fell more than \$100 million in 1965 as prices adjusted downward to the reduced loan level. However, almost all of this drop was made up by payments to wheat growers under the 1965 Wheat Program.

Market prices in 1965 for most feed crops averaged slightly below 1964 levels. The volume of hay and sorghum grain marketed was higher in 1965, but sales of corn, oats, and barley were down.

Receipts from cotton marketings were lower in 1965 due to a slight drop in the loan rate and a decline in production. Cotton yields per acre were record-high but acreage harvested was down from a year earlier. Cotton farmers received \$70 million under the Domestic Allotment Choice Program in 1965 compared with \$39 million in 1964.

Tobacco production was down 14 percent in 1965 due to a greatly reduced planted acreage and cash receipts from this crop were reduced.

Receipts from marketings of oil-bearing crops were up more than \$200 million as a substantially larger soybean crop was marketed at slightly higher prices than in calendar 1964.

Higher prices for potatoes and truck crops in 1965 resulted in an increase of \$400 million in cash receipts from vegetables. Receipts from fruits and nuts were lower than in 1964 due mostly to lower citrus prices.

Total production expenses in 1965 were 4 percent higher than in 1964. Nearly half of the increase of \$1.1 billion was due to higher outlays for purchased livestock (fig. 3).

Farmers' expenditures for fertilizer and lime rose in 1965 chiefly because of increased quantities purchased, as unit prices remained fairly steady.

Aggregate outlays for feed, repair, and operation of capital items, and for most of the miscellaneous items, were little changed from a year earlier.

Outlays for hired labor were down in 1965 by \$76 million as the decline in number of hired workers offset higher farm wage rates. The upward trend in mechanization continued to reduce labor requirements on many farms. Farm overhead costs, including taxes paid by farmers, continued upward in 1965.

For Groups of Farms

In 1965, as is usual, changes in farm incomes from the previous year varied considerably within the major groups of farms. Generally income changes from year to year are not in the same direction on all farms and ranches within a major group. In 1965, however, incomes were up from 1964 on all farm types in the Corn Belt, spring wheat and winter wheat areas and on cattle and sheep ranches in the West. They were also up on New Jersey egg-producing farms and Southern Coastal Plains peanut-cotton farms. They were mixed on dairy, broiler, cotton, and tobacco farms.

On the dairy type farms, incomes in 1965 were above a year earlier on 2 farm types, below on 2, and

about the same in both years on 1. In Eastern Wisconsin net farm incomes declined 7 and 8 percent respectively on grade-A and grade-B farms. On grade-B dairy farms in Western Wisconsin net farm income averaged 58 percent above a year earlier. Net farm income was 34 percent above that of 1964 on dairy-hog farms in Southeastern Minnesota and was unchanged on dairy farms in the Central Northeast. Milk prices averaged higher in 1965 on all of these dairy farms and milk sales per farm were greater than in 1964. However, on the dairy farms where incomes declined, reduced crop production and higher operating expenses offset increased milk receipts. In Western Wisconsin and Southeastern Minnesota, farm production was up substantially due mostly to increased crop production.

On poultry farms, net farm incomes in 1965 varied from about the same as in 1964 on Maine broiler farms to an increase of 126 percent on broiler farms in Georgia. Broiler production per farm was greater than in 1964 on all of the broiler farms studied. However, contractual payments per 1,000 birds produced in 1965 ranged from nearly 4 percent below a year earlier in Maine to 23 percent above the previous year in Georgia. Georgia broiler growers also realized higher returns in 1965 from crop and livestock production and sales. In Delmarva, contractual payments advanced nearly 2 percent in 1965. Incomes were up 13 percent on specialized broiler farms; on broiler-crop farms, income advanced 44 percent. Delmarva broiler-crop farmers had an excellent crop year in 1965 and sales of crops exceeded broiler returns by nearly \$2,800 per farm. Net farm incomes on Delmarva broiler-crop

farms and Georgia broiler farms were record-high in 1965.

On 5 of 10 types of cotton farms studied, incomes in 1965 were from 6 to 425 percent above those of 1964. On the other 5 types, incomes declined from 4 to 24 percent. Greater production in 1965 was chiefly responsible for higher incomes on cotton farms in the Black Prairie and High Plains of Texas. Prices received for cotton in 1965 averaged about the same as or slightly lower than a year earlier on all of the cotton farms studied. Higher prices received for potatoes on cotton-specialty crop farms in the San Joaquin Valley of California in 1965 helped to offset the effect of lower farm production and contributed to a 23-percent rise in net farm income. Both farm production and average prices received were below 1964 levels on the 5 types of cotton farms where incomes declined. In addition, on 4 of these 5 types operating expenses were up from 2 to 3 percent from a year earlier.

On tobacco and tobacco-cotton farms in the Coastal Plain of North Carolina, net farm incomes were below those of 1964; but on tobacco-livestock farms in the Bluegrass Area of Kentucky, returns increased. Production on the Coastal Plain farms in 1965 was substantially below a year earlier. However, in the Kentucky area lower production of tobacco in 1965 was offset by increased livestock production. Prices received averaged significantly higher than in 1964 on tobacco farms in both areas.

On the Corn Belt farms studied, net farm income rose from 1964 to 1965. Increases ranged from 4 percent on cash grain farms to 86 percent on hog fattening--beef raising

farms. Farm production increased in 1965 on Corn Belt farms and except for cash grain farms, prices received averaged considerably above those of 1964. On the cash grain farms greater production in 1965 more than offset a decline in average prices received and higher operating expenses.

On spring wheat and winter wheat farms net farm incomes averaged from 1 to 69 percent higher in 1965 than in 1964. Net farm production was greater than in 1964 on all but the wheat-fallow farms in the Pacific Northwest. In 1965 prices received on wheat farms ranged from a decrease of 1 percent below 1964 on wheat-grain sorghum farms, Southern Plains, to 7 percent above, on wheat-corn-livestock farms in the Northern Plains. Prices received for wheat averaged slightly below those of 1964 except in the Pacific Northwest where the price was about the same in both years. In 1965, Government payments on wheat farms were generally above those of 1964 and were substantially higher than in 1963.

For Western livestock ranchers 1965 was, in general, a good year. Incomes averaged higher than in 1964 on both cattle and sheep ranches in the 4 important areas studied. In the Southwest, returns in 1965 were up 148 percent from a year earlier on sheep ranches and 369 percent on cattle ranches. Incomes in the Northern Plains advanced 25 and 26 percent, respectively, on typical sheep and cattle ranches. Net ranch income was up 25 percent on cattle ranches in the Intermountain Region and was 23 percent above 1964 income on sheep

ranches in Utah-Nevada. Prices received for cattle and sheep averaged higher than in 1964 on the ranches studied. Net ranch production increased on all except sheep ranches in the Northern Plains, where it was about the same in both years. Market weights of the respective classes of livestock sold on these ranches averaged higher in 1965 because of improved range conditions. Ranges improved the most in the Southwest, recovering partially from the drought of 3 years. Due chiefly to the improvement in range conditions and reduced outlays for feed, operating expenses were reduced substantially on ranches in the Southwest in 1965. On sheep ranches in Utah-Nevada, net ranch production was record-high in 1965. Lambs were marketed at record-high weights and prices received averaged the highest since 1952.

On egg-producing farms in New Jersey net farm incomes increased 80 percent from 1964 to 1965. Both farm production and prices received were up in 1965 and operating expenses were held at about 1964 levels. Lower feed prices in 1965 enabled these egg producers to reduce operating expense per unit of production about 5 percent.

On peanut-cotton farms in the Southern Coastal Plains both farm production and prices received were higher in 1965 than in 1964. Higher prices for peanuts, cattle, and hogs all contributed to increasing farm income. Prices received for cotton, the second important income-producing enterprise on these farms, remained unchanged from 1964 to 1965.
