Introduction	2
Relation of feeds consumed by dairy cows to level of butterfat production, Southeastern Minnesota, 1938-43	4
Feed costs and returns from milk cows (dairy and dual purpose), Southeastern Minnesota, 1928-43	5
Feed costs and returns from dairy cows, Southeastern Minnesota, 1940-43	7
Feed costs and returns from dairy cows, Southwestern Minnesota, 1940-43	8
Feed costs and returns from dual purpose cows, Southeastern Minnesota, 1940-43	9
Feed costs and returns from dual purpose cows, Southwestern Minnesota, 1940-43	10
Feed costs and returns from other cattle (dairy and dual purpose), Southeastern Minnesota, 1928-43	11
Feed costs and returns from other dairy cattle, Southeastern Minnesota, 1940-43	12
Feed costs and returns from all dairy cattle, Southeastern Minnesota, 1940-43	12
Feed costs and returns from other dairy cattle, Southwestern Minnesota, 1940-43	13
Feed costs and returns from all dairy cattle, Southwestern Minnesota, 1940-43	13
Feed costs and returns from other dual purpose cattle, Southeastern Minnesota, 1940-43	14
Feed costs and returns from all dual purpose cattle, Southeastern Minnesota, 1940-43	14
Feed costs and returns from other dual purpose cattle, Southwestern Minnesota, 1940-43	15
Feed costs and returns from all dual purpose cattle, Southwestern Minnesota, 1940-43	15
Feed costs and returns from a beef breeding herd, Southeastern and Southwestern Minnesota, 1940-43	16
Feed costs and returns from feeder cattle, Southeastern and Southwestern Minnesota, 1940-43	17
Feed costs and returns from feeder sheep, Southwestern Minnesota, 1940-43	18
Feed costs and returns from a farm flock of sheep, Southwestern Minnesota, 1940-43	18
Feed costs and returns from a farm flock of sheep, Southeastern Minnesota, 1928-43	19
Feed costs and returns from hogs, Southeastern Minnesota, 1928-43	21
Feed costs and returns from hogs, Southwestern Minnesota, 1940-43	23
Feed costs and returns from chickens, Southeastern Minnesota, 1928-43	24
Feed costs and returns from chickens, Southwestern Minnesota, 1940-43	25
Feed costs and returns from turkeys, Southeastern Minnesota, 1933-43	26
Feed costs and returns from turkeys raised for meat production, Southeastern and Southwestern Minnesota, 1936-43	27
Feed costs and returns from turkeys, Southwestern Minnesota, 1940-43	28
Feed costs for horses, Southwestern Minnesota, 1940-43	28
Feed costs for horses, Southeastern Minnesota, 1928-43	29
Average price of feeds, Southeastern Minnesota, 1928-43	30
Average price of feeds, Southwestern Minnesota, 1940-43	31

Introduction

The Division of Agricultural Economics and the Division of Agricultural Extension of the University of Minnesota, the Bureau of Agricultural Economics of the United States Department of Agriculture, and the county extension services of a number of southern Minnesota counties are cooperating with farmers in two cooperative farm management services. The Southeastern Minnesota Farm Management Service started operation January 1, 1928 and the Southwestern Minnesota Farm Management Service January 1, 1940. These associations were organized for the purpose of studying the farm business through farm records. Each farmer who cooperates in this service pays an annual fee which covers a part of the cost. The balance of the cost is defrayed by the University of Minnesota which uses the records as a basis for research and extension work.

It is the purpose of this report to bring together all of the statements of livestock feed costs and returns which are presented in the annual reports prepared for the two associations. These data should be an excellent source of basic information for farm planning. They represent results in livestock production and unit feed costs under ordinary farm conditions as contrasted with the results of experimental feeding. They should prove useful to individual farmers as a basis for comparison with their own accomplishment or for the purpose of planning their livestock operations or checking their feed supplies against livestock needs. They should also be especially valuable for teaching and extension work and for all types of farm planning and farm program making both for the individual farm and for an area, State, or region. Although the farmers included in this study are, in general, above average in managerial ability and operate farms that are larger and more productive than the average of their communities, the levels of livestock production and quantities of feed per unit of product represent an accomplishment well within the grasp of most other farmers in the area.

Each enterprise statement shows the quantity and market value of feeds consumed per unit of livestock, the returns from livestock, and other information on rates of production. The report also shows the amount by which the total value of the livestock production exceeds the feed cost. Two measures of "return over feed cost" are shown, (1) the return over feed per unit of livestock, and (2) the return per \$100 of feed. In interpreting these figures and especially in making comparisons between different classes of livestock, it must be understood that this is not a "net return." In addition, there are other costs such as labor, power, shelter, taxes, insurance, interest, equipment and other items that must be met from the gross income. In case of meat animals, such as hogs or beef cattle, feed is the largest single item of cost, in fact, it may constitute up to 75 percent or more of the total cost. On the other hand, with dairy and poultry, labor, shelter, and equipment make up more than 50 percent of the total cost and there must be a much larger relative return over feed costs if the farmer is to cover these items and have any profit left over.

The average number of head of livestock is determined for each year by adding the number on hand at the beginning and end of each month and dividing this total by 24. The number of animal units is used in some of the statements and it represents a specific number of head of the various species of livestock--1 cow, 1 bull, 1 head of feeder cattle, 5 hogs, 10 pigs, 7 sheep, 14 lambs, or 100 hens.

The net increase in value of the animals is calculated by subtracting the value of the purchases and the value of the beginning inventory from the sum of the value of the closing inventory, sales and animals slaughtered for home use. To secure the total value produced or gross returns for livestock that produce a product such as milk, butterfat, eggs, or wool the value of the products sold, used in the home or fed to other classes of livestock is added to the net increase in the value of the animals.

The pounds of livestock produced is determined in a manner similar to the method of calculating the net increase in value except that pounds are substituted for values. The pounds of butterfat per cow, the number of eggs per hen, etc., includes in addition to sales the quantity used in the home or consumed by other livestock.

Most of the farm-raised feeds as well as the more common or standard commercial feeds are valued at average prices at the farm. Prices are reported by the fieldman in each area every month. The miscellaneous commercial feeds are valued at the price the farmer paid for them. The value of skim milk is based on a specific formula with an adjustment downward to take into account waste on the farm (value of 100 pounds of skim milk = value of 1/8 bushel of corn + value of 3.5 pounds of tankage less an estimated amount to take care of waste on the farm). Non-marketable feeds, such as corn silage, were valued on the basis of their feeding value relative to similar feeds for which a market price was available. Straw used for feed is not included in either the quantity or value of feeds. Quantities of feed, with the exception of pasture, are given in terms of pounds rather than bushels or tons. All corn has been reduced to a shelled corn basis, that is 56 pounds per bushel.

Table 1.- Relation of feeds consumed by dairy cows to level of butterfat production, Southeastern Minnesota, 1938-43*

* The data in this table show the kinds and amounts of feed used at different levels of production. In the following tables only annual average for the average level of production is given. The information in this table may be used in making approximate adjustments in feed consumption data in the other tables to the level of production to which it is to be applied.

* Butterfat production is computed on the basis of butterfat sold or otherwise utilized. (See page 2.) To compare with production as shown by the usual cow testing association methods this figure should be increased 10 to 15 percent.

** Not including nutrients received from pasture. *** All dairy cows which have at some time in the past freshened are included in the milking herd, and affect the average number of cows used in computing this table. There is some variation in the number of months of dry period per cow; however, this variation is small for the majority of farms.
