SOURCE OF DATA

Method of Study

A three-year study of the organization and management of a selected group of farms in Winona County was started on March 1, 1935. This study is being conducted under the supervision of the Division of Agricultural Economics of the University of Minnesota in cooperation with the Bureau of Agricultural Economics of the United States Department of Agriculture. Farms which were representative of the better managed farms of the area were chosen with the aid of the county agricultural agent, Mr. H. C. Pedersen.* The farmers cooperating in this study keep a complete record of cash receipts and expenses, a daily record of the labor used on each crop and class of livestock, and a record of farm produce used in the house. These records are checked at least twice per month by a field man and supplemented with inventories, feed records, reports of cropping practices and yields, and other significant facts about the farm business. The data collected are sent to the central office at University Farm, St. Paul, where a detailed set of records for each farm is kept. From these records, this report on livestock costs and returns for 1936 was prepared.

METHODS OF COMPUTING AND PRESENTING DATA

The comparative costs and returns for each of the different classes of livestock maintained in 1936 are presented in this preliminary report. All data are shown on the basis of a standard unit such as one head or 100 pounds gain in weight. Both quantities--pounds of feed, days of pasture, man and horse hours, pounds produced, etc.--and money costs and returns are shown. The amounts of feed, with the exception of pasture, are given in pounds rather than in bushels or tons. All corn has been reduced to a shelled corn basis. The man hours include both regular daily chore labor and irregular labor such as tending sick animals, marketing livestock and livestock products, and hauling feed and bedding. The horse hours likewise include both regular and irregular work.

Local prices were used, insofar as possible, in determining the costs and returns. Marketable feeds were charged at local prices and non-marketable feeds on a comparative-feeding-value basis. No charge was made for straw or for corn stalk pasture. Man labor was figured at 20 cents per hour and horse work was charged to the individual farm at the rate determined for that farm. The shelter charge was

*For a description of the area and of the farms studied, see Division of Agricultural Economics Mimeographed Report No. 81, A Preliminary Report of Crop Production Costs in 1936 in Winona County, Minnesota.

Note: Completion of this project was made possible by workers supplied on Federal Students' Work Project, 1936-37, project number 39-100. Sponsor: University of Minnesota.

based on the annual cost of the buildings housing livestock, prorated on the basis of the space occupied. The equipment charge is based upon the annual cost of the particular equipment used by that class of livestock. The expense for portable brooder houses and hog houses has been included in the equipment charge and omitted from the shelter charge. The equipment charge also includes a charge for the use of the auto and truck in connection with the livestock work. Interest has been calculated at five per cent on the average of the beginning and ending inventories. Miscellaneous cash costs include such cash expenses as veterinary fees, medicine, salt, minerals, hatching expense, fuel for brooders, incubators, and tank heaters, horseshoeing, sheep-shearing, etc. In arriving at the manure credit, consideration was given to the kind and the amount of feed consumed and the proportion of the fertilizing elements returned in the manure. Credit was allowed for manure produced, regardless of whether or not it was utilized.

The value of livestock production was determined by adding the sales, the products used in the house and the ending inventory and then deducting from this sum the sum of the beginning inventory and purchases. In the case of the different classes of cattle, transfers from one group to another were considered the same as purchases and sales. The weight produced was calculated in the same manner as the value produced except that weights were used instead of values.

In studying the tables and in considering the income from livestock, one should keep in mind that these are comparative figures and represent charges which are not all actual cash expenses. The feed, man labor, horse work, use of buildings and equipment, and interest on the investment have been charged to the enterprise, although they may represent very little direct cash outlay. Therefore, a minus return means that the particular class of livestock has failed to pay the usual market prices charged for the different factors. There may be no other more profitable alternative use for the buildings, much of the labor, or for the non-marketable feeds. A return above the price of marketable feeds and cash expenses may justify continued production although these figures fail to show a gain.

The returns have been expressed in several ways. The gain is the amount left after deducting all the charges listed in the table. The return over feed cost is what is left after deducting the feed cost from the value of the product, excluding manure. In other words, the return over feed cost and the manure are what the farmer has to pay him for his labor, the horse work, shelter, equipment, interest and miscellaneous cash costs. The return per hour represents what the enterprise returned for each hour of man labor used by it, after all charges except labor had been deducted. In each case, a minus (-) indicates a failure to meet the particular expenses involved. The individual farm figures have been arranged in order of increasing cost or decreasing returns, so that the farm with the lowest cost or the greatest return appears at the top of the table. In this way, each cooperator may quickly see how he compares with the other cooperators.

Cattle

Cows: The costs and returns are for cows only. They neither include any feed or expense for the bull nor any credit for calves born. Due to the fact that calves were in some cases allowed to nurse for a short time, it was necessary to estimate their consumption of whole milk while nursing. It was assumed that the calves that were nursing received two gallons of milk per day. The value of the dairy products fed includes all milk and skimmilk fed to calves as well as to the other classes of livestock. The butterfat per cow was calculated by dividing the total butterfat utilized (including that sold, used in the house, and fed to livestock) by the average number of cows in the herd.

Other Cattle: Other cattle include all cattle except the cows. The data for the herds where calves were raised only for replacement or for sale as veal or breeding stock are placed in one group; the data for the herds where some cattle, raised or purchased, were fattened for sale as beef are placed in another.

All Cattle: Expenses and returns per animal of all cattle, including cows and other cattle, are presented. In these statements any milk used by calves is included in the feed and in the credit for dairy products fed to livestock.

Sheep

In the tables for sheep, the number of head is the average number of mature head for a year when two lambs up to six months of age are considered equal to one mature sheep. The fleece weight was calculated by dividing the total clip by the number of sheep sheared. The per cent death loss is based on the total number of sheep and lambs, regardless of the length of time that they were on the farm. The lambs raised per ewe is the number of lambs raised to six months of age divided by the number of ewes at lambing time.

Hogs

The number of pigs per litter was calculated by adding together the number of pigs raised to six months of age and those that were sold or butchered at an earlier age. This sum was divided by the number of litters farrowed. The average market weight and the price received per hundred pounds are based on the total sales of hogs and pigs. The pounds of hogs produced include any gain in weight of breeding hogs and likewise the expenses include the cost of maintaining the breeding herd. In the table of money costs and returns, the gain is the difference between the net expenses per hundred pounds and the selling price. It does not include any receipts from corn-hog benefit payments. The return over feed is the difference between the feed cost and the selling price.

Chickens

The data for chickens are presented on the basis of one hundred hens. In a few instances, a small number of ducks or geese were raised. In such cases, the feed, labor, and other expenses, and the receipts for ducks and geese are included. Portable brooder houses were considered as equipment in arriving at the costs for shelter and equipment. The division of the costs between the production of eggs and the production of poultry was made on the basis of the income from each.

Work Horses

Average costs per horse and per hour of horse work are presented.

Tractors

The number of hours tractors were operated and the cost per hour of operation are presented in this report for both two-plow and three-plow tractors. The labor of the regular farm workers used in servicing and repairing is charged at twenty cents per hour. The use of the automobile, truck and horses in repairing or servicing is charged at the rates found on the farm involved. Miscellaneous cash costs include the cash cost of repairing, parts, etc. Interest is calculated on the average of the beginning and ending inventories.

Trucks

The labor charge for trucks is the value, at twenty cents per hour, of the time the regular farm workers spent in repairing and servicing the trucks. It also includes a charge for any use of horses or automobile in repairing the truck. Miscellaneous cash costs include the cost of the license, repairs, parts, tires, insurance and also greasing when it was done at a service station. The miles driven are based on a check of the speedometer reading at the beginning and end of the year.

Automobiles

The cost of automobile operation is calculated in the same manner as the cost of truck operation.
