Executive Summary

The South Carolina counties classified as coastal are Beaufort, Berkeley, Charleston, Colleton, Dorchester, Georgetown, Horry and Jasper. These are the eight counties that comprise the coastal zone management region of the [Ocean and Coastal Resource Management](#) division of the South Carolina Department of Health and Environmental Control.

From 1990 to 2000:

- The eight coastal counties had approximately one-fourth of the state's growth in population (28.1%), households (29.3%), labor force (28.8%), employment (20.1%), and income (27.1%);
- Growth in population along the coast concentrated in Horry and Beaufort counties; Horry led growth in employment, with Beaufort, Charleston, and Berkeley counties providing significant contributions;
- The coastal counties of Colleton and Jasper experienced relatively rapid growth in economic activity, but their overall contribution to coastal and state growth was minor.

Near the start of the 21st century in South Carolina:

- State industry output was \$184 billion with \$40 billion generated in the eight coastal counties. Total output of the coastal economy matched its population share (22.0%);
- About 560,000 of the state's 2.2 million employees worked in the coastal counties.

- Coastal counties contributed more than their population share to employment (25.0% of the state total), employee compensation (22.9%), proprietor income (25.8%), property income (25.6%), indirect business taxes (26.1%) and total value added (24.0%).

Service; Trade; and Finance, Insurance, and Real Estate sectors led coastal growth:

- Services employment growth was about 30% above the employment change predicted based on national and industry trends.
- Coastal output made up 31% of state output in Finance-Insurance-Real Estate (FIRE), 28.5% of state output of Services, and 25.3% of Trade output.
- One in four state jobs in Services, Trade and FIRE were in coastal counties.
- Nearly 30% of state value added in Services, Trade and FIRE was generated along the coast.
- 2000 per capita income of the coastal region (\$20,189) was higher than the level for noncoastal counties (\$18,344).
- Resident income *in coastal tracts* was about \$5.2 billion in 2000. Other residents in the coastal region accounted for about \$12.6 billion in income. Overall, the residents of coastal tracts accounted for 29% of total income in the eight counties.
- In the highest income group, households with more than \$75,000 in income, the coastal tracts made up 36% of all coastal region income.
- Nearly one in ten new, South Carolina residents over the 1990s were attracted to Horry County, alone; Beaufort garnered another 7% of the new S.C. residents.
- While Charleston's loss of the naval base slowed its population growth, income grew impressively.

- Together, the “big three” coastal counties - Beaufort, Horry and Charleston - continue to drive the coastal economy. Economic and demographic trends suggest that they will continue to expand steadily over the next decade and propel the coastal region to an increasing share of state economic activity.

THE CONTRIBUTION OF THE COAST TO THE SOUTH CAROLINA ECONOMY

I. Introduction

It is no surprise to anyone who has visited the beaches of South Carolina from Myrtle Beach to Hilton Head that the coast of South Carolina is a vibrant and expanding economic region. However, the magnitude of the contribution that the coast makes to the state economy is often overlooked. This is unfortunate because the coast is well positioned to become a key driver of state economic growth over the next decade as the national economy continues its move to service activities as a leading economic base.

In this report, we provide two levels of analysis on the role that the coast makes to the level and growth of the state's economy. First, we document the contribution that the eight South Carolina coastal counties make to state economic activity. The South Carolina counties classified as coastal are Beaufort, Berkeley, Charleston, Colleton, Dorchester, Georgetown, Horry and Jasper. These are the eight counties that comprise the coastal zone management region of the [Ocean and Coastal Resource Management](#) division of the South Carolina Department of Health and Environmental Control. Coastal employment, output and value added are compared with state totals to find the coastal shares of state economic activity and the coast's role in state growth over the 1990s.

The second level of analysis focuses geographically on South Carolina census tracts that are contiguous to the coast. Economic and demographic changes from 1990 to 2000 in these coastal tracts are used to contrast coastal and non-coastal tract growth from 1990 to 2000. Finally, we examine the economic impacts of consumer spending by coastal tract residents on the coastal region economy.

II. Coastal Shares of State Economic Activity.

Databases used to identify coastal economic and demographic trends include: U.S. Census for 1990 and 2000, the Regional Economic Information Service (REIS) of the U.S. Department of Commerce, and the Impact Model for Planning (IMPLAN). Additionally, using IMPLAN, social accounting matrices (SAMs) are estimated for the coastal counties and the state. The SAMs are used to derive a consistent profile of economic activity by major industry across the state and each coastal county. Metrics of economic activity included the contributions of coastal counties to state output, value added and employment.¹

Table 1 presents a summary of the contributions that the coast made to the state economy. Industry output across ten major industry divisions summed to a total of \$184 billion in the state in 1998 with \$40 billion generated in the eight coastal counties. About 560,000 of the state's 2.2 million employees worked in the coastal counties. The leading employers in the state were Services (545,848), Trade (488,383), Government (378,089) and Manufacturing (368,110). The coast was a major player in each of these industries with the exception on Manufacturing. Along the coast, the leading employers included Services (156,993), Trade (133,955), Government (103,997), Construction (49,917),

¹ Output estimates represent the gross revenues (sales revenues) earned by all establishments in a sector with the exception of trade. For example, hotel sector output is the total revenue earned by each hotel. Similarly, restaurant (eating and drinking) output is the gross revenues (sales revenues) earned by all restaurants.

The only exceptions to the definition of output as gross revenues are in the wholesale and retail trade sectors. For wholesalers and retail stores, only the trade markup between what they pay for goods and their sales revenues are counted as output. Value added is the difference between total output (sales) and the cost of purchased inputs needed to produce a good or service. It can be broken down into four main components: **Employee compensation** (wages, salaries and fringe benefits), **Proprietary income** (income earned by the self-employed – sole proprietors or owners of small businesses like retail stores, doctors and lawyers), **Other property type income** (rents, royalties, dividends distributed to individuals and other corporate profits), and **Indirect business taxes** (excise taxes, property taxes, fees, licenses and sales taxes paid by businesses). These definitions are from MIG, Inc. 1999. *IMPLAN Professional, Version 2.0 Users Guide*. MIG: Stillwater, Mn.

Finance-Insurance-Real Estate or FIRE (37,348). Manufacturing along the coast provided 39,057 jobs in 1998.

Value added (the sum of employee compensation, proprietor income, property income and indirect business taxes) emphasizes the relative importance of manufacturing outside the coast. For the entire state, Manufacturing value added (\$21.4 billion) exceeded that for any other industry. However, along the coast, value added in Manufacturing (\$2.294 billion) ranked below Government (\$4.879 billion), Services

Table 1. South Carolina and South Carolina Coast Output, Value Added and Employment

Source: Micro IMPLAN Group, 2000.

(\$4.555 billion), FIRE (\$4.417 billion), and Trade (\$4.084 billion).

The contrast between the economic structure of the coast and the rest of the state, as well as the contributions of the coast to total state economic activity, are highlighted in Table 2. Each of the **boldface entries** in Table 2 indicates a coastal share that exceeded the coastal population share, 22.0%. Total output of the coastal economy matched its population share (22.0%); however, coastal counties contributed more than their population share to employment (25.0% of the state total), employee compensation (22.9%), proprietor income (25.8%), property income (25.6%), indirect business taxes (26.1%) and total value added (24.0%).

These shares of aggregate economic activity may understate the importance of the eight coastal counties to the state. In the fast growth industries (Services, FIRE and Trade), the coast outperformed the state. Coastal output made up 30.9% of state output in Finance-Insurance-Real Estate (FIRE), 28.5% of state output of Services, and 25.3% of Trade output. Similar coastal shares were evident for both employment and value added in these industries. Roughly one in four state jobs in Services, Trade and FIRE were in the eight coastal counties. Nearly 30% of state value added in these industries was generated along the coast. In contrast, the coast was a relatively small contributor to state Manufacturing employment (10.6%) and value added (10.7%). However, Manufacturing was a relatively slow growth industry, *in terms of job generation*, in the nation, state, and along the coast as documented in the final section of this report.

* Millions of Dollars. Source: Micro Implan Group, 2000.

TCPU is transportation, communications, public utilities; FIRE is finance, insurance and real estate.

Note: **Boldface** indicates Coastal Share exceeds Coastal Population Share of 22.0% in 2000. S.C. Coast includes Beaufort, Berkeley, Charleston, Colleton, Dorchester, Georgetown, Horry, and Jasper Counties. Base year is 1998.

In summary, both the aging of the baby boomers and the increasing share of service activity in the national and state economies are likely to expand the demand for employees to meet job growth along the coast of South Carolina. As documented in Tables 1 and 2, the eight coastal counties in South Carolina already accounted for about one in four jobs in the fast growth sectors of the state's economy. Accordingly, it is likely that the coast will become increasingly important to the overall growth of the South Carolina economy and the well being of its residents.

III. Coastal County Shares of Coastal Economic Activity.

Across the eight coastal counties, there is substantial variation in size and economic characteristics. Three coastal counties accounted for 75% the coast's contribution to economic activity in the state: Beaufort, Charleston, and Horry (see Table 3). Charleston was the overall dominant employer and producer of goods and services

with about 41% of the coastal totals. Horry was second in overall economic size with about 20% of coastal economic activity followed by Beaufort accounting for about 14% of the coastal economy. Together, Berkeley (10%), Dorchester (7%), Georgetown (5%), Colleton (3%) and Jasper (1%) generated about one-quarter of the coast's total contribution to the state economy. Output, employment and value added contributions of each county to the state's economy are shown in Appendix I.

In the next section of the report, demographic and economic changes over the past decade in the coastal counties are presented along with a look at important income and population trends in the counties and the census tracts that have a coastal connection.

IV. Demographic and Economic Change in Coastal Counties, 1990-2000

The population of South Carolina's 46 counties increased by 525,000 from 1990 to 2000. Over one-fourth of the state's growth in population (147,819) occurred in the eight counties along the coast, and over 40% of the population growth in the coastal counties (60,300) was in the 46 census tracts (out of 169 tracts) with coastline (Figure 1). Coastal census tracts are located in only six of the eight coastal counties. No tracts were included for Berkeley and Dorchester counties. *Over 10% of the state's population growth from 1990 to 2000 occurred in the narrow band of census tracts adjacent to the Atlantic Ocean.*

Figure 1. Population Change in South Carolina, 1990 - 2000

Source: 1990 & 2000 Census, U.S. Bureau of the Census

The South Carolina coastal counties, especially the coastal tracts within these counties, were significant contributors to the state's recent growth. Labor force growth rates in the coastal counties exceeded those of the rest of the state by approximately 25.0% (17.7% vs. 14.2% for population change and 14.4% vs. 11.3% for labor force

growth), and the number of households in coastal counties increased at a rate over 33.0% higher than the rate of household growth for noncoastal counties (27.1% vs. 20.3%). The more rapid growth of households relative to population and labor force reflects the attraction of retirees to the coastal areas. Retiree households generally consist of only one or two persons, and many retirees do not participate in the labor force.

Figure 2. Percentage Growth in Population, Households, and Labor Force, Coastal Counties and Rest of S.C., 1990 - 2000

Source: 1990 & 2000 Census, U.S. Bureau of the Census; REIS, Bureau of Economic Analysis

The 1990 to 2000 growth in population, households, and labor force for the eight coastal counties is presented in Table 4. All coastal counties experienced population growth, led by Horry County with 52,576 new residents and Beaufort County with

34,513 additional residents. In terms of relative growth, Beaufort County had the largest percentage change in population since 1990 (39.9%), followed by Horry (36.5%) and Jasper (33.5%) counties. Population change in Berkeley (10.8%), Charleston (5.1%) and Colleton (11.3%) counties was relatively slow, and these three counties had population growth rates less than the rate for the rest of the state (14.2%).

The change in the number of households in the coastal counties mirrors the findings for population change. Five of the counties (Beaufort with 48.3%, Horry with 46.7%, Georgetown with 33.1%, Jasper with 32.9%, and Dorchester with 23.0%) had growth rates for the number of households that exceeded the average for the rest of the state (20.8%). As before, the growth rates for households for Berkeley (17.8%), Charleston (15.1%) and Colleton (20.2%) counties lagged the rate of growth for the noncoastal part of the state.

County labor force is the number of county residents actively seeking or holding employment, regardless of where they hold jobs. All coastal counties except Berkeley, Charleston and Colleton had labor force growth rates that significantly exceeded the rate for the rest of South Carolina. For Berkeley, Georgetown, Horry, and Jasper Counties, the rate of growth of the labor force was almost identical to the counties' population growth rates. In these three counties, the labor force participation rates (labor force/population) remained relatively constant from 1990 to 2000. Thus, the share of county population that was working or seeking work (as opposed to retired, in school, or

pre-school) remained stable. In Beaufort and Charleston Counties, however, population growth rates exceeded labor force growth rates, and the counties' labor force participation rates declined from 1990 to 2000. The relatively slow growth in county labor force probably reflects (a) the large number of retirees attracted to these counties, and (b) the increasing importance of in-commuting from neighboring counties to work in the growing coastal counties.

Population Change in Coastal Census Tracts, 1990-2000

The 1990 and 2000 populations and numbers of households for the census tracts along the South Carolina coast are provided in Tables 5 and 6, respectively. The changes in county population and households in coastal and noncoastal census tracts are summarized in Tables 7 and 8 and Figure 3. For the coastal versus noncoastal comparisons we identified 46 coastal census tracts in the eight coastal counties. Coastal tracts for 1990 and 2000 were matched to ensure that the same areas were compared for the two census years. For example, Beaufort County 1990 tract numbers 13-20 were aggregated to match 2000 tract numbers 101-113. These tracts were grouped for each census year so that geographic area was constant from 1990 to 2000. In addition, some 1990 tracts were divided into two or more tracts by 2000 (as was the case in Georgetown County). In this case we compared one 1990 tract with multiple 2000 tracts. Tract maps are provided in Appendix II.

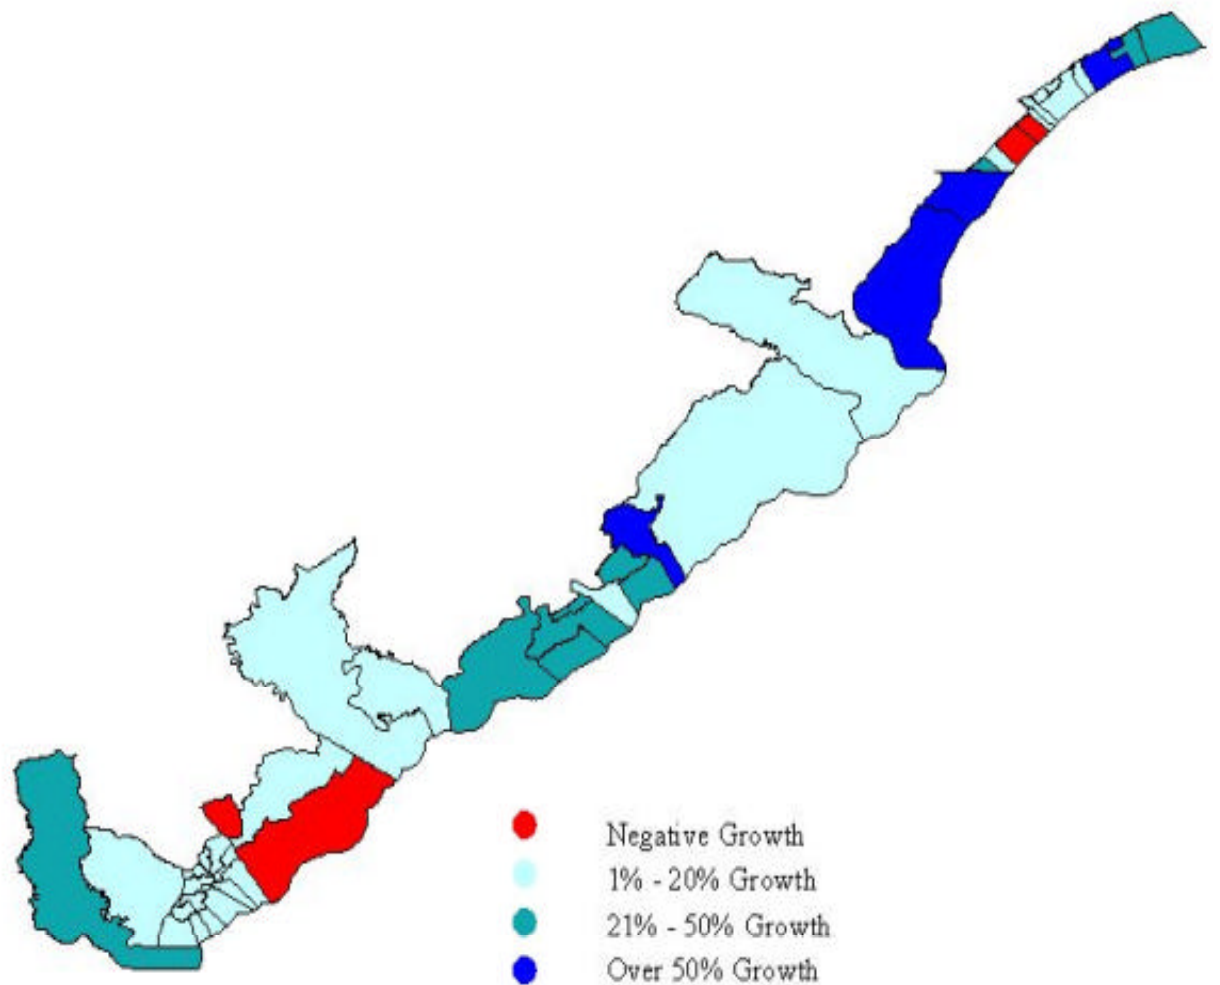

Population change in Beaufort, Charleston, and Georgetown counties was driven by growth in the counties' coastal areas. Specifically, population growth in coastal tracts accounted for 82.8% of population growth in Beaufort County and 78.4% of the growth in Georgetown County. In Charleston County, the coastal census tracts accounted for all

of the county's growth from 1990 to 2000. That is, the Charleston County coastal tracts added 17,166 new residents while the remainder of the county reported a population loss of 2,236 individuals. Interestingly enough, the noncoastal areas of Charleston County reported 8,274 net new households from 1990 to 2000 (Table 8). An increase in the number of households, accompanied by a decline in population, indicated that average household size declined significantly in the noncoastal tracts of Charleston County.

The smallest relative contribution to county population growth by coastal tracts was reported for Horry County. The Grand Strand's coastal tracts accounted for only 9.7% of the county's 1990-2000 population growth. The coastal areas relatively small role in county growth probably is attributable to the lack of developable land along the coast, thus new residential developments generally were located in the county's interior.

Finally, the population change in the coastal tracts in Colleton (292) and Jasper (611) counties was not large. In each of these two counties, however, only one census tract was classified as "coastal," thus references to growth in coastal tracts refer primarily to development in Beaufort, Charleston, Georgetown, and Horry Counties.

Figure 3. Coastal County Census Tracts , Population Growth, 1990-2000

Source: U.S. Census Bureau

Note: 2000 Beaufort County Tracts 101-113 and Georgetown County Tracts 9805.01 & 9805.02 were combined for comparison to 1990 data.

Employment Change in Coastal Counties

Employment change by major industry divisions for coastal and noncoastal counties is presented in Table 9. Tables 9 (a) through 9 (h) provide the 1990 and 2000 employment data for the eight individual coastal counties. The totals for private civilian employment indicate that job growth in the coastal counties accounted for much of the state's overall civilian employment growth during the 1990s. Specifically, the eight coastal counties reported an increase of 134,158 private sector jobs while the remaining 40 counties experienced only 226,927 net new jobs. Thus approximately one out of every three net new civilian jobs was created in the eight coastal counties, and most of this coastal employment growth was the result of rapid job growth in Charleston and Horry counties. Employment change in Charleston and Horry was 85,833 or approximately 64% of total employment growth for the coastal counties.

The coastal counties' overall impact on state total employment growth (private sector plus government) was significantly dampened by large losses in federal and military employment since 1990. Government employment declined by 18,987 in the eight coastal counties while the thirty-eight noncoastal counties experienced a net increase of 41,323 government jobs. Most of the cutbacks in government employment were focused on Charleston and Horry counties. Charleston's employment in federal civilian and military jobs declined by 31,921 from 1990 to 2000, and Horry County federal civilian and military employment fell by over 4,000 over the same period.

Shift-Share Analysis of Employment Change

Shift-share analysis is a methodology for disaggregating a region's employment growth into three components: national growth, industry mix, and competitive shift. The *national growth component* is the change in industry employment if the region's industry grew at the national employment growth rate (20.6% for the U.S. from 1990 to 2000).

The *industry mix component* is the employment change in a region attributable to the region's allocation of jobs among fast- and slow-growing industries. The mix component for an individual industry (e.g., Services) will be positive if that industry had more rapid growth than the overall national average. Alternatively, a negative industry mix value results if the industry's employment growth rate lagged the overall national employment

The net impact of expanding civilian and declining government jobs was employment growth in the coastal counties of 24.4% compared to an employment increase of 18.9% for the noncoastal counties. Relatively rapid employment growth along the coast also resulted in a small increase in the share of the state's total employment in the eight coastal counties. In 1990, the coast had 25.0% of the state's jobs, and by 2000 the coastal counties' share had increased to almost 26.0%.

Industry Employment Change

The 1990 to 2000 growth rates of employment by major industry divisions are summarized in Figures 4 and 5. Percentage employment change in the coastal counties exceeded that of the rest of the state for every civilian industry division except Wholesale Trade and Transportation/Public Utilities. Coastal employment growth rates were highest in Services (56.1%); Finance, Insurance, and Real Estate (38.9%); and Construction (37.4%). The Services and Retail Trade sectors generated the most new employment opportunities in the coastal counties with retail trade employment growing by 29,038 and services expanding by 63,805 jobs. Manufacturing, on the other hand, added only 837 net new jobs to the coastal economy from 1990 to 2000; however, manufacturing in the rest of the state declined by 10.8% or 38,152 jobs. Employment in state and local government also was a significant contributor to coastal county employment growth. State and local government enterprises added 16,387 net new jobs in the eight coastal counties for a 1990-2000 growth rate of 31.8%. State and local government employment in noncoastal counties grew by only 22.3%. The more rapid growth in the coastal counties reflects the rapid increase in population and households and the resulting increased demand for public services.

growth rate. The sum of the mix components for a region's industry divisions provides an overall measure of the employment generation potential of the region's industrial base. For example, a positive industry mix value for the region indicates that region had a disproportionately large share of rapidly growing industries relative to the nation.

The *competitive shift component* is the change in regional employment after accounting for national employment growth and industry mix. A positive shift value reflects more jobs in the region than can be explained by industry mix and national growth trends. In other words, the region is said to exhibit a "competitive advantage" if the region is attracting more than "its share" of the nation's employment for that sector. A negative shift component value reflects a "competitive disadvantage" for the region.

The estimated values for the three components of employment change were calculated as follows:

(1) National Growth Component for Industry i, Region j

$$NGC_{ij} = E_{ij}^{t-1} \left(\frac{E_n^t}{E_n^{t-1}} \right) - E_{ij}^{t-1}$$

(2) Industry Mix Component for Industry i, Region j

$$IMC_{ij} = \left[E_{ij}^{t-1} \left(\frac{E_{in}^t}{E_{in}^{t-1}} \right) - E_{ij}^{t-1} \right] - NGC_{ij}$$

(3) Competitive Shift Component for Industry i, Region j

$$CSC_{ij} = \left(E_{ij}^t - E_{ij}^{t-1} \right) - NCG_{ij} - IMC_{ij}$$

where E = employment

i = industry

j = region

n = nation

t = 2000

t-1 = 1990

The results of the shift-share analysis for the coastal and noncoastal counties are presented in Tables 10 and 11, respectively. Of special interest are the last columns in each table-- the employment “shift” or employment change above that attributable to just matching overall national growth trends. The coastal counties had positive “competitive shift” values for all civilian industrial sectors, indicating that coastal employment growth in every major industrial division was stronger than the national average for that division. Especially impressive was the growth of employment in Services in the coastal counties. The South Carolina coast would have added 42,734 (23,393 + 19,341) new service jobs from 1990 to 2000 if service employment in the coastal counties mirrored national trends. However, service employment growth was 63,805 or 21,071 jobs above the employment change predicted based on national and industry trends. A large, positive shift component for an industry indicates that the region has a strong competitive advantage in attracting or stimulating employment in that sector relative to the nation as a whole.

The noncoastal counties of the state exhibited positive “competitive shift” values for all major employment divisions except Construction (-24,194) and Manufacturing (-27,242). These findings show that the noncoastal counties would have had over 51,000 more jobs in construction and manufacturing if the region had just matched national employment trends. Retrenchment of the textile and apparel industries in the face of increasing international competition contributed significantly to the negative employment shift in manufacturing in the noncoastal counties.

Source: REIS 1960-2000. U.S. Department of Commerce, Bureau of Economic Analysis.

Note: In 2000, Berkeley, Colleton, Georgetown, and Jasper Counties had missing data for Ag. Services & Mining sectors due to disclosure. Ag. Services and Mining sectors were combined for this worksheet. In doing so, the employment figure was calculated as the difference between the total civilian employment figure and the remaining sectors. Beaufort County had missing data for the Mining and Wholesale Trade Sectors. The Mining employment figure for 1990 was also used for 2000 and Wholesale Trade Sector employment was calculated as the difference between the total civilian employment and the remaining sectors.

A finding of special interest from the shift-share analysis is the total increase in state employment resulting from the competitive shift and the percentage of this shift attributed to the eight coastal counties. From 1990 to 2000, over 51,000 of the net new jobs (34,721 + 15,314) created in the state were the result of employment growth above that attributable to industrial composition and national expansion. Of these 51,000 new jobs, 34,721 or 68.1% were located in the eight counties along the coast. Thus, the state's coastal economy was responsible for more than two out of every three jobs that the state attracted because of its competitive advantage relative to other states.

Income Growth in Counties

The relatively rapid growth in population and employment in the coastal counties is reflected in the levels and growth of income in the counties (Table 12). First, nominal income in the coastal counties grew more rapidly (86.7%) than in the rest of the state (80.1%). Total nominal incomes in Beaufort (133.4%), Georgetown (115.3%), Horry (119.9%), and Jasper (136.8%) more than doubled from 1990 to 2000. Second, and more importantly from an economic development perspective, the 2000 per capita income of the coastal region (\$20,189) was higher than the level for noncoastal counties (\$18,344). More impressive, however, is the fact that seven coastal counties, led by Georgetown (78.7%) and Jasper (77.4%), counties, had 1990 to 2000 growth rates in per capita income that exceeded the noncoastal growth rate (56.1%). Only Berkeley county, with a per capita income growth rate of 54.3%, lagged the growth rate for the noncoastal counties. The rapid growth of per capita incomes in coastal counties relative to the rest of the state contributed to a widening income gap between the coastal and noncoastal economies. In 1990, the ratio of coastal to noncoastal per capita income was 1.08, but by

2000 this ratio had increased to 1.10. The 1990s were a period of divergence between the incomes of the top and bottom income classes in the United States, a divergence that is reflected in the spatial distributions of per capita incomes in South Carolina.

Impacts of Coastal Tract Resident Income on the Coastal Region

Another perspective on the contribution that the coast makes to the economy is the effect that consumer spending by residents of coastal tracts has on the regional economy. These consumer related economic impacts on the region are part of the totals previously reported in Table 1 and 2. Total resident income in coastal tracts was about \$5.2 billion in 2000 (about 4.95 billion in 1998 dollars) while other residents in the coastal counties accounted for about \$12.6 billion in income (see Table 13).

Overall, the residents of coastal tracts accounted for 29% of total income in the eight counties. And in the highest income group, households with more than \$75,000 in income, the coastal tracts made up 36% of all coastal region income. With the exception of the lowest income group, coastal tract households with incomes between \$10,000 and \$75,000 received from 19% to 24% of coastal region income in those income groups. Residents in coastal tracts received about 29% of the income going to the region's households with less than \$10,000 in annual income.

This coastal tract income of \$5.2 billion is allocated to eight levels of household income in Table 13. Using IMPLAN consumer spending profiles in the coastal SAM, we constructed estimates of consumer spending, *in the coastal counties*, that is associated with this coastal income. After converting the income to 1998 prices to conform with the IMPLAN database, as shown in Table 14, when taxes, savings, and out-of region imports were deleted from total income, \$1.95 billion in local consumption remains. This

consumer spending was allocated to ten major industry groups in the region with Services (\$522 million), Trade margins (\$491 million) and Finance, Insurance and Real Estate, FIRE(\$477 million) the three leading sector destinations for consumer spending.

Using the SAM multiplier matrix for the coastal region economy, we find that the gross sales impact of the consumer spending was about \$3.3 billion. The value added impact was about \$2 billion while resident income of \$1.2 billion can be attributed to spending by residents of coastal tracts in South Carolina (see Table 14).

V. Summary: The Coast's Contribution to the State's Economy

The South Carolina coast consists of only eight counties versus 38 counties for the remainder of the state, yet from 1990 to 2000, these eight counties were responsible for approximately one-fourth of the state's growth in population (28.1%), households (29.3%), labor force (28.8%), employment (20.1%), and income (27.1%) as shown in Table 15. The growth in population along the coast was concentrated in Horry and Beaufort counties while Horry led growth in employment, with Beaufort, Charleston, and Berkeley counties providing significant contributions. The coastal counties of Colleton and Jasper experienced relatively rapid growth in the five measures of economic activity, but their overall contribution to coastal and state growth was minor.

The Services; Trade; and Finance, Insurance, and Real Estate sectors - each of which is a fast growth sector nationally and at the state level - have led this growth. Service employment growth was about 30% above the employment change predicted based on national and industry trends -- indicating that the region has a strong competitive advantage in services relative to the nation as a whole.

Coastal output made up 31% of state output in Finance-Insurance-Real Estate (FIRE), 28.5% of state output of Services, and 25.3% of Trade output. One in four state jobs in Services, Trade and FIRE were in the eight coastal counties. Nearly 30% of state value added in these industries was generated along the coast. In contrast, the coast was a relatively small contributor to state Manufacturing employment – about 11%.

Importantly from an economic development perspective, the 2000 per capita income of the coastal region (\$20,189) was higher than the level for noncoastal counties (\$18,344). Total resident income in coastal tracts alone was about \$5.2 billion in 2000.

Other residents in the coastal region have accounted for about \$12.6 billion in income. Overall, the residents of coastal tracts accounted for 41% of total income in the eight counties. And in the highest income group, households with more than \$75,000 in income, the coastal tracts made up 36% of all coastal region income.

Finally, nearly one in ten new, South Carolina residents over the 1990s were attracted to Horry County, alone; Beaufort garnered another 7% of the new S.C. residents. While Charleston's loss of the naval base slowed its population growth, income grew impressively. Together, these "big three" coastal counties continue to drive the coastal economy. Economic and demographic trends suggest that they will continue to expand steadily over the next decade and propel the coastal region to an increasing share of state economic activity.
