University Farm
St. Paul 1, Minnesota
May, 1953

INDEX

	Page
Introduction and definitions	1 - 2
Average inventories and financial statement	3
Costs and returns per acre for oats and barley	4 - 5
Costs and returns per acre for flax, soybeans and corn silage	6 - 7
Costs and returns per acre for corn for grain	8 - 9
Costs and returns per acre for alfalfa mixtures	10 - 11
Costs per acre of establishing grass and legume seedings	12
Land utilization and average yields	13
Costs and returns per 100 pounds feeder cattle produced	12 - 13
Costs and returns per head of dairy cattle	14 - 15
Costs and returns per head of other dairy cattle	16 - 17
Costs and returns per cow for all dairy cattle	18 - 19
Costs and returns per 100 pounds hogs produced	20 - 21
Costs and returns for chickens - per hen	22 - 23
Costs per hour of operating tractors	24 - 25
Costs of operating tillage machinery	26
Costs of operating hauling equipment	27
Costs of operating corn planters	28
Costs of operating grain drill and other grain seeding equipment	29
Costs of operating corn cultivators	30
Costs of operating fertilizer and spray equipment	31
Costs of operating hay mowers and rakes	32
Costs of operating grain binders, threshers and field choppers	33
Costs of operating swathers and combines	34
Costs of operating corn pickers	35
Costs of operating balers	35
Costs of operating portable elevators	36
Costs of operating manure loaders and spreaders	37
Summary of machinery costs and custom work hired	38 - 39
Source and use of labor by type of farm	40 - 41 - 42
Use of tractor hours by enterprise	43
Average rates of performance for field work	44
Seasonal distribution of man labor (per cent)	45

Introduction

A study of farm labor and farm costs was begun on a selected group of farms in southern Minnesota on January 1, 1951. This is part of a broad study of farm organization and factors affecting earnings of farmers in Minnesota. The specific objectives of this phase of the study are: (1) to determine the labor requirements and factors affecting labor efficiency on farms; (2) to compare the costs and returns for different crop and livestock enterprises, and (3) to obtain data on the costs of operating farm machinery.

Data were obtained from 33 farmers in 1951 and 29 farmers in 1952. They were scattered over the southern quarter of the state. All of these men were members of the Southeast and Southwest Minnesota Farm Management Services. In connection with those services they kept records of their inventories, purchases, sales, crops produced, feeds fed, livestock changes, and farm products used in the house. In addition, they kept records of the use of their labor, power, and operations performed on their crops. These records were kept by the farmers, but were checked at intervals by the research workers to insure uniformity.

Some of the information gained in 1952 is presented in this report. Since it is hoped that this report will be used as a source of information, the data are presented with a minimum of discussion. In most of the tables the data for each farmer are presented; this will give an opportunity to study the relationships among the various items of costs and returns.

The Weather in 1952

Weather is an important factor affecting the physical inputs of labor and machinery required in agricultural production. It also affects the yields of various enterprises. The 1952 mean annual precipitation ranged from 0 to 8.5 inches below normal for the area. The mean temperature as well as the length of the growing season were somewhat above normal, resulting in only a negligible amount of soft corn.

Methods of Computing and Presenting the Data

GENERAL ITEMS:

Man labor was charged at an uniform rate of 80 cents per hour for all labor. This rate is the average of what farmers in the area paid, or estimated they would have to pay, to a married man. It includes a charge for house, garden, and a certain amount of farm produce.

Tractor power was charged at cost for each individual farm. A weighted average was used for all tractor hours wherever the farmer used more than one tractor.

Truck was charged at 10 cents per mile.

Auto was charged at 6 cents per mile.

Horse power was charged at average cost for the farms using horses. (\$.35 per hour)

Interest charges for use of all types of farm capital was computed by taking 5 per cent of the average inventory value.

CROP SUMMARIES:

Seed was charged at cost. In the cases where seed was home grown the average 1952 market price plus a cleaning charge was used.

Manure was charged at one dollar per ton plus the cost of hauling. The charge was distributed to the crops in the following way: 40 per cent to the field to which the manure was applied, and 60 per cent to other fields normally receiving manure.

Commercial fertilizer was charged at cost excluding P.M.A. refunds. The entire charge was made to the crop to which the fertilizer was applied.

Crop machinery was charged according to the number of acres on which each machine or group of machines was used for a particular crop. (For costs see computation of machinery costs).

Land charge. A uniform charge of \$10 per acre was used. This represents a close approximation of the average cash rent for land without buildings in 1952.

Building charge. No building charge was made for the storage of crops.

Prices used in determining value produced represent an average of 1952 prices received in the area.

LIVESTOCK SUMMARIES:

Feed costs include all feeds bought, home grown feeds at average 1952 farm prices and a charge for pasture ranging from \$.16 per head-month for hogs to \$2.50 per head-month for cows and feeder cattle.

Shelter costs were computed by taking 2.25 times the annual depreciation. The figure 2.25 arose because, on the 29 farms under study, it was found that an average of \$1.25 had to be spent for each \$1.00 depreciation in order to cover such outlays as interest on investment, insurance, taxes, repairs, and maintenance. The resulting shelter costs were distributed between individual livestock enterprises according to floor space occupied.

Equipment costs for livestock were computed by adding together depreciation, interest on investment, repairs and maintenance.

Value produced represents the sum of products marketed, used in the house, fed to livestock, and changes in inventory.

POWER AND MACHINERY COSTS:

Depreciation was copied directly from the farmer's account book. No attempt was made to standardize depreciation schedules for similar machines except to the extent that this was done in the regular accounting work.

Shelter costs were computed in the same manner as shelter costs for livestock. They were distributed according to floorspace occupied by tractors and according to initial cost of crop machinery.

Summary of Farm Earnings

Items	Average of 20 farms ^{1/}		Items	Average of 20 farms ^{1/}	
	8 farms ^{2/}			8 farms ^{2/}	
Farm Receipts:					
Dairy cows	\$1,000	\$ 138	Dairy cattle bought	\$ 164	\$ 54

1/ Five farms had sheep and one farm had turkeys. A percentage distribution would not be meaningful.

* Total hours on all farms divided by total number of farms (29).

2/ Includes meetings, general business, auctions, etc.
