<sup>1</sup> Co-workers in the TelFarm project were: R. Betz, L. Borton, R. Clark, G. Kole, T. Purdy, W. Schauer, D. Stein, and V. Varner with the assistance of Michigan State University Extension Agents. AgriSolutions co-workers were Kelly Tobin, Steve Eshelman, Janice Raymond, Tiffany Aldrich, Anne Gerke, Kathleen Spranger, and Lynette Wood. Farm Credit Services of Wisconsin co-worker was Steve Zimmerman.

## Executive Summary

This report summarizes the financial and production records of 18 Michigan tree fruit farms. To be included, the farms must have produced at least 50 percent of gross cash farm income from one or a combination of sales from cherries, apples, and other fruits. The records came from Michigan State University's TelFarm/MicroTel project, the Farm Credit Service system, or by AgriSolutions in Michigan. The values were pooled into averages for reporting purposes.

Farm records were included if a farm financial summary was completed on 2002 data including beginning and ending balance sheets, plus income and expenses. The data was checked to verify that cash and debt discrepancy were within an acceptable range. While considerable variation in the data exists, average values are reported in the summary tables that follow.

### *Synopsis of Michigan's Tree Fruit*

According to the United States Department of Agriculture (USDA) and National Agricultural Statistics Service (NASS) data, the Michigan fruit season of 2002 was one of the worst in recent history. Michigan's fruit trees, apples, cherries, and peaches, were damaged by spring frost followed by cool wet weather. Summer conditions were hot and dry followed by a wet fall. These climatic conditions reduced fruit growth and promoted widespread disease in these major crops. This resulted in both lower returns and higher costs. Table 1 provides fruit bearing acres, yields per acre, the five year average yields per acre and prices received for apples, cherries sweet and tart, and peaches.

**Table 1. Michigan Agricultural Statistical Service Summary of Tree Fruit**

Fruit	2002 Avg. Bearing Acres	2002 Avg. Yield (lbs/acre)	1998-2002 Avg. Yield (lbs/acre)	2002 Price (\$/lb)	1998-2002 Avg. Price (\$/lb)
Apples	41,000	12,200	18,240	0.124	0.972
Cherries, Sweet	7,400	720	5,668	0.428	0.292
Cherries, Tart	27,000	556	6,843	0.479	0.243
Peaches	4,700	2,980	7,122	0.318	0.275

### *Data Sorting*

The 2002 Business Summary uses different sort criteria than previous summaries. In the past, farm financial data were sorted on Net Farm Income (NFI), is a measure of profit. For 2002, the sort uses the Rate of Return to Assets (ROA) based on market value. This is a measure of profitability that includes price appreciation on assets. The switch from using net farm income to rate of return on assets for sorting does not change the average values across all farms.

Net farm income (NFI) is the starting point for calculating ROA. To calculate ROA, interest paid is added back to NFI and the resulting figure is the return to all assets and also the return to unpaid labor. When the value of unpaid labor is subtracted from the prior calculated figure and the resulting figure is divided by average assets, ROA is determined. Rate of return on assets is a measure of how much profit the farm business assets generated. Accounting for total farm assets allows for a meaningful comparison across all farm sizes (e.g., operations with 5 acres of fruit and those with 100 acres of fruit). ROA reveals how both equity and borrowed capital are performing, because ROA is calculated as if the farm had no debt. ROA is the return to all assets.

*Summary of Results*

In 2002, the average tree fruit farm size in the business analysis was 170 acres owned and 114 acres cropped, (Table 2).

Table 2. Average 2002 Michigan Tree Fruit Farm Characteristics

Total acres owned	170
Total crop acres	114
Average price/bushel apple	\$3.95
Number of farms	18

Gross cash farm income, total of all farm income before expenses are deducted, averaged \$162,474 in 2002. The two largest components of these revenues were apple sales and cherries (sweet and tart) sales, \$40,709 and \$44,168 respectively. The third largest revenue was other crops, which averaged \$26,751. Government payments averaged \$10,088 per farm in 2002. Insurance payments were also important sources of income in this difficult year.

Net cash farm income, gross cash farm income (\$162,474) less total cash farm expenses (\$122,311), resulted in an average net cash farm income of \$40,164. With less income these tree fruit farms were not able to hold inventory constant, with total inventories decreasing an average of \$37,839.

Net farm income is the profit (loss) remaining after all farm expenses and inventory changes have been recognized. The net farm income value is the return to the operator's unpaid management, labor, equity capital invested and family labor (Table 3). Net farm income in 2002 averaged a negative \$12,564. This average somewhat obscures a very large range of net farm income values. For example, the net farm income median was a negative \$14,845 and the range was \$91,630 to a negative \$102,271. The average does illustrate that 2002 was a tough year.

**Table 3. Average 2002 Tree Fruit Farm Income Statement**

	Avg. of all Farms	Avg. of High 25%
Gross cash farm income	162,474	189,695
Total cash expense	122,311	129,572
Net cash farm income	40,164	60,123
Inventory change	-37,839	-16,741
Depreciation and capital adjustments	-14,888	-15,691
Net farm income	-12,564	27,691

Four key financial performance indicators are presented in Tables 4 and 5. The rate of return on assets (ROA) is calculated as if the farm has no debt. ROA indicates debt-free farm earnings, after subtracting an allowance for operator's unpaid labor, management, and family labor, as a percentage of invested assets. ROA provides the key summary performance indicator for a farm. By multiplying the operating profit margin (OPM), dollars of profit generated per dollar of revenue, by the asset turnover rate, the efficiency with which farm assets generate revenue, the ROA is determined. The ROA data presented in Tables 4 and 5 indicates a troubling trend with declines in performance for 2002.

The rate of return on equity (ROE) represents the farm earnings after interest payments expressed as a percentage of owner equity capital. Ideally the ROE should be higher than the ROA indicating that returns are being made on borrowed money (and conversely which is the case in Table 4). The figure in this summary indicates that profitability on these farms was a challenge in 2002.

Table 4 compares profitability for 2000, 2001 and 2002 with assets valued at cost. Profitability indicators calculated using assets valued at cost is good for comparing the same farm over time. The range for ROA in 2002 was a high of 6.9% to a low of negative 23.8%. The average 2002 tree fruit farm ROA was a negative 6.0 percent which was below the 2001 average ROA of 3.6 percent. Return on equity shows even a greater loss, from 0.8 percent in 2001 to a negative 6.0 percent in 2002. Operating profit margin in 2002 averaged a negative 21.8 percent and in 2001 averaged 7.8 percent. Asset turnover ratio in 2002 was 27.4 percent and in 2001 it was 45.9 percent. This decrease of 40 percent indicated that the farm assets were less efficient in 2002 mostly because of low yields. The trend with respect to profitability on the cost side is that 2002 was a difficult year when compared against 2001.

**Table 4. Average Tree Fruit Farm Profitability Indicators, 2000-2002**

	2000	2001	2002
	(Percent)		
Rate of return on assets*	-5.6	3.6	-6.0
Rate of return on equity	-29.7	0.8	-14.1
Operating profit margin	-12.0	7.8	-21.8
Asset turnover rate*	46.7	45.9	27.4

\* Assets valued at **cost** value (rather than market value).

Table 5 compares profitability measures across three years, 2000, 2001 and 2002, with assets valued at market. The market value approach includes the impact of value appreciation (inflation) of the asset base overtime. Land is the main source of appreciation and it reflects a form of income. Financial performance indicators like ROA can be looked upon in this comparison as the “opportunity cost of capital” of farming versus alternative investments. Market value for assets is more appropriate when comparing across different farms.

The average return on assets (ROA) for 2002 was 3.2 percent, which was 63 percent below the 2001 average ROA of 8.6 percent. The range for ROA in 2002 was a high of 20.4% to a low of negative 12.3%. Return on equity (ROE) for 2002 was 2.9 percent and 2001 the ROE was 9.6 percent, a 70 percent decrease. Operating profit margin (OPM) measures the dollars of profit generated per dollar of revenue. In 2002 the OPM was 24.4 percent and in 2001 the OPM was 38.8, a 37 percent decrease. Asset turnover ratio measures the efficiency with which farm assets generate revenue. In 2002, the asset turnover ratio was 13.2 percent and in 2001 the ratio was 22.1 percent, a decrease of 40 percent, meaning that the farm assets generated less dollars per dollar invested in farm assets. Again, the trend with respect to profitability is that 2002 was a difficult year when compared with 2001 and 2000. The reason the ROA is higher when using market values is mainly related to appreciation in land values.

**Table 5. Average Tree Fruit Farm Profitability Indicators, 2000-2002**

	2000	2001	2002
	(Percent)		
Rate of return on assets*	-0.7	8.6	3.2
Rate of return on equity	-3.9	9.6	2.9
Operating profit margin	-3.0	38.8	24.4
Asset turnover rate*	22.8	22.1	13.2

\* Assets valued at market value (rather than cost value).

The following tables provide additional details for the figures discussed earlier.
