## **A TRADE AREA ANALYSIS OF WISCONSIN COUNTIES: AN UPDATE FOR 2010**

### Abstract

For updated Trade Area Analysis (TAA) of Wisconsin counties we use the sales tax data as reported by the Wisconsin Department of Revenue for 2010. Only those counties that have elected to collect the optional county sales tax are included in the analysis. Because sales tax data are used one must keep in mind that the analysis focuses only on taxable sales and may not reflect the total level of activity in the county. Using Pull Factors and measures of Surplus and Leakage the relative strengths, and weaknesses, of local retail and service markets are identified. Changes in Pull Factors from 2005 to 2010 are provided to gain insights into growing and declining sectors. Finally, an update of simple Wisconsin retail market thresholds estimates (i.e., number of customers required to support an establishment) is also provided.

### Introduction<sup>1</sup>

When a community is exploring economic development options one area of interest is local retail and service markets. Communities naturally ask “are local retail and service businesses reaching their fullest potential or are there weaknesses that need to be addressed?” In order to address these basic questions communities need to have basic insights into the relative strengths and weaknesses local retail and service markets. One approach to identify these local strengths and weaknesses is to examine patterns in current sales activities using the tools of Trade Area Analysis.

The power of Trade Area Analysis (TAA) is the simplicity of the tools and the ease of interpretation. Community economic development practitioners have found that due to this simplicity TAA has embraced by community leaders, businesses and concern citizens. The tools of Trade Area Analysis have proven to be a powerful foundation upon which to build a conversation about community economic development options. Indeed, some businesses have found these tools to be useful in developing business feasibility plans and have been accepted by a number of bank loan officers.

The weakness of Trade Area Analysis is the lack of spatial detail. The data, in the case of Wisconsin, are provided at the county level (and only for counties that have implemented the county option sales tax) which may or may not reflect the true spatial market area. In our case here, from a purely economic perspective, the county is an arbitrary political boundary that may or may not reflect local retail and service markets.

Because the TAA reported here ignores the spatial element of the community's markets local knowledge of shopping opportunities and behavior is extremely important. There may be very sensible

---

<sup>1</sup> For a more detailed discussion of alternative methods to analyze local retail and service markets, see the UW-Extension program entitled “Downtown and Business District Market Analysis” by Bill Ryan and Matt Kures at <http://www.uwex.edu/ces/cced/dma/>.

reasons why TAA identifies a particular weakness or strength. For example, one community may be found to have large weaknesses in motor vehicle sales suggesting a market potential. But it may be the case that a neighboring community has a large concentration of automobile dealerships (a strength for that community) and hence easily explains the initial weakness for the community of interest. Knowledge of the condition of surrounding markets is vital to interpreting the results of the analysis presented here. The key is that TAA can serve as a foundation for a conversation about local retail and service markets.

What we will do in the following few pages is to review the tools of Trade Area Analysis and some of the simplifying assumptions that allows the analysis to move forward. Initially, residents in the local market or trade area of interest (e.g., the county) have the same tastes and preferences across the state. This assumption allows the community practitioner to compare the local market to a state average. We then show methods of estimating demand with unique trade area characteristics. As described above the trade area is defined by the availability of data and the geographic area that the data are reported. For this particular study we will use sales tax data reported by the Wisconsin Department of Revenue at the county level. Specifically, counties that have imposed the local option sales tax are included in this analysis. Because the data is drawn from tax sales receipts on taxable sales are considered. If a particular item or service is not included in the tax base, then no data is available. Hence care must be taken and one must keep in mind that the analysis is of “taxable sales”. Still, the analysis provides one set of information that can be used to develop a picture of the local retail and service market.

### Trade Area Analysis

*Sales retention* is an indirect measure of locally available goods and services, assuming people buy locally if possible. While measurement of actual sales is relatively easy, measurement of the sales potential presents some difficulty. This assumes that not only are tastes and preferences are identical but also that the local trade area is demographically similar to the state. *Local potential sales* can be estimated by statewide average sales per capita adjusted by the ratio of local to state per capita income (Deller, et.al. 1991; Hustedde, Shaffer & Pulver 1993; Shaffer, Deller & Marcouiller 2004; Stone & McConnen 1983):

$$PS_s^i = P_s * PCS_{state}^i * \frac{PCI_s}{PCI_{state}} \quad (1)$$

where  $PS_s^i$  is potential sales in community  $s$  for sector  $i$ ,  $P$  is population,  $PCS$  is per capita sales,  $PCI$  is per capita income.

Care must be used in accepting the computed potential sales from equation (1). It ignores all of the shopping area and consumer characteristics that are located within the immediate and surrounding shopping areas. The potential sales provided from equation (1) assume no differences in local consumption patterns except adjusting by relative local income. For example, the approach of Trade

Area Analysis used here does not account for differences in the socioeconomic characteristics of the region, other than income. But this readily calculated estimate represents a realistic initial estimate.

One way to estimate the sales retention just divide actual sales by sales potential. Actual sales can be gotten from a variety of sources, including census of business, sales tax data, and the merchants themselves. Another approach to sales potential estimates the number of people buying from local merchants (Hustedde, Shaffer & Pulver, 1993; Stone & McConnen, 1983). The *Trade Area Capture* estimates the customer equivalents. Trade Area Capture used in conjunction with the *Pull Factor* permits the community to measure the extent to which it attracts nonresidents (e.g., tourists and nonlocal shoppers) and differences in local demand patterns.

Trade Area Capture estimates the number of customers a community's retailers sell to. Most trade area models consider market area as the function of population and distance. Trade Area Capture incorporates income and expenditure factors with the underlying assumption that local tastes and preferences are similar to the tastes and preferences of the state. The verbiage here can become somewhat confusing in that the phrase trade area discussed above has a definite spatial meaning, but Trade Area Capture is aspatial. Thus, the Trade Area Capture estimate suffers from the same caveats enumerated for Potential Sales estimated:

$$TAC_s^i = \frac{AS_s^i}{PCS_{state}^i * \frac{PCI_s}{PCI_{state}}} \quad (2)$$

where notation remains the same with the addition of *TAC* is Trade Area Capture and *AS* is actual sales.

The number calculated from equation (2) is the number of people purchased for, not the people sold to or actual customers in the store (i.e., if one person buys food for a family of four, all four are counted). If Trade Area Capture exceeds the trade area population then the community is capturing outside trade or local residents have higher spending patterns than the state average. If the Trade Area Capture is less than the trade area population the community is losing potential trade or local residents have a lower spending pattern than the statewide average. Further analysis is required to determine which cause is more important. Comparison of the Trade Area Capture estimates for specific retail or service categories to the total allows for additional insight about which local trade sectors are attracting customers to the community. It is important to make Trade Area Capture comparisons over time to identify trends.

Trade Area Capture measures purchases by both residents and nonresidents. The *Pull Factor* makes explicit the proportion of consumers that a community (the primary market) draws from outside its boundaries (the secondary market, including residents in neighboring areas or tourists). The Pull Factor is the ratio of Trade Area Capture to municipal, in our case here county, population. The Pull Factor

measures the community's drawing power. Over time, this ratio removes the influence of changes in municipal population when determining changes in drawing power. The Pull Factor is computed as:

$$PF_s^i = \frac{TAC_s^i}{P_s} \quad (3)$$

A Pull Factor ( $PF$ ) greater than one implies that the local market is drawing or pulling in customers from surrounding areas. A Pull Factor less than one implies that the local market is losing customers to competing markets. The Pull Factor, much like percent sales retention estimate, can also be loosely interpreted like a location quotient. Pull Factors significantly greater than one often indicates an area of specialization for the local market. For example, tourist areas tend to have high Pull Factors and location quotients for restaurants, hotels and miscellaneous retail stores. The use of any tool by itself can often lead to erroneous conclusions. One must use a variety of tools to gain a clearer understanding of the local economy.

An alternative way to think about sales retention is to compute local *Surplus* or *Leakage* by looking at the difference between actual sales ( $AS$ ) with Potential Sales ( $PS$ ):

$$S / L_s^i = AS_s^i - PS_s^i \quad (4)$$

If actual sales ( $AS$ ) is larger than Potential Sales ( $PS$ ) and equation (4) is positive then there is said to be a Surplus, or the local market is performing better than one would expect. One could reasonably interpret a Surplus as the dollar value of the Pull Factor being greater than one. If actual sales ( $AS$ ) is smaller than Potential Sales ( $PS$ ) and equation (4) is negative then there is said to be a Leakage, or the local market is performing below what one would expect. Again, one could reasonably argue that a Leakage is the dollar value of the Pull Factor being less than one.

#### Core Data for Analysis

Before turning to the Trade Area Analysis for Wisconsin counties that have sales tax data two core pieces of information are required. The first is the Index of Income and the second are per capita expenditure levels for the state. The Index of Income is reported in Table 1 along with the county population and per capita income. For this analysis 62 counties have imposed a sales tax from which the data are derived.

Fifty-five of the 62 have an Index of Income below one with three counties (Rusk, Juneau and Vernon) having per capita income below 75 percent (Index of Income below 0.750) the Wisconsin average. Because of the relatively low income levels we would not expect spending in these counties to be on par with the state average and these averages are adjusted downward as described above. At the

same time one would expect counties that have higher income levels (e.g., Dane, Ozaukee and Washington) to have higher spending levels than the state average and thus are adjusted upward.

Table 1: Wisconsin County Index of Income

	Population	Per Capita Income	Index of Income		Population	Per Capita Income	Index of Income

Langlade	20,008	32,196	0.861	Wood	73,932	38,248	1.023

The second set of data is the state per capita expenditure levels provided in Table 2. It is vital to recall that the data are drawn from taxable sales, not total sales. As a result the estimated potential sales as well as surplus/leakage levels are conservative. This is particularly true for the service sectors where taxable sales are low when compared to retail sales. Thus care must be taken when interpreting the Trade Area Analysis for the service sector.

The largest single category of expenditures is general merchandise stores (\$1,391). There are two potential reasons why this category is the largest: (1) the growing popularity of “big-box” stores such as Wal-Mart and Target is drawing a larger share of consumer dollars and (2) many of the “super” stores

## Wisconsin Per Capita Taxable Sales 2010

<u>Taxable Retail Sales</u>	
Motor Vehicle and Parts Dealers	1,386.16
Furniture and Home Furnishings Stores	193.65
Electronics and Appliance Stores	239.31
Building Material and Garden Equipment and Supplies Dealers	826.13
Food and Beverage Stores	408.84
Health and Personal Care Stores	158.31
Gasoline Stations	341.73
Clothing and Clothing Accessories Stores	374.40
Sporting Goods, Hobby, Book, and Music Stores	200.47
General Merchandise Stores	1,390.96
Miscellaneous Store Retailers	860.64
Nonstore Retailers	180.99
Retail Trade Total	6,561.60
<u>Taxable Services Sales</u>	
Information	1,218.45
Finance and Insurance	57.54
Rental and Leasing Services	274.08
Professional, Scientific, and Technical Services	376.16
Administrative and Support Services	116.59
Amusement, Gambling, and Recreation Industries	107.83
Arts, Entertainment, and Recreation	183.96
Accommodation	263.96
Food Services and Drinking Places	1,213.76
Repair and Maintenance	284.30
Personal and Laundry Services	286.19
Other Services (except Public Administration)	603.17
Merchant Wholesalers, Durable Goods	717.75
Merchant Wholesalers, Nondurable Goods	263.29

have expanded into carrying groceries which in direct competition to more traditional food stores. The second largest category is motor vehicle and parts dealers (\$1,386) and is largely attributed to the expensive of automobiles. Indeed, historically this category has been the largest single source of taxable sales and has only recently been surpassed by general merchandise stores. The third largest category is the broad

"Information" classification (\$1,218) which includes taxable publishing industries, broadcasting, telecommunication and a small handful of others (NAICS code 51). This is largely sales taxes on cable access (except internet) and cell phone services. Food services (e.g., restaurants) and drinking places (i.e., taverns and bars) was the fourth highest expenditure category with per capita spending of \$1,214. It is these state level average taxable expenditure levels that are used, after adjusting for the Index of Income, that form the foundation for the Trade Area Analysis.

### Trade Area Analysis Results

The analysis is presented in two sets, one for taxable retail sales the second for taxable service sales. In addition to the tabular presentation of the results for Trade Area Captured, Pull Factors, Potential Sales and Surplus/Leakage I have presented the Pull Factors in map form. It is important to

note that there are at least two reasons why there may be no data for a particular category for any given county. First, issues concerning disclosure of data that can be used to identify individual firms prohibit the Department of Revenue from releasing the data. These cases are identified by “S” in the tables to indicate suppressed data. The second is that there are no businesses within the particular category that are reporting taxable sales. Also note that not all counties have elected to impose the local option sales tax and those counties are not included in the tables and are “blank” in the maps.

. The volume of results prevents a discussion of all of the results and I have left it to the reader to draw the relevant information for their own purposes. The reader must keep in mind that attention in developing strategies to build local retail and service markets must consider both Leakages as well as Surpluses. Naturally, the tendency will be to want to focus on addressing weaknesses in the markets, but there may be solid reasons why such weaknesses exist ranging from lack of market size (small populations such as in Florence county may be a real barrier to the creation of certain types of businesses) to spatial competition from neighboring communities. But focusing attention on sectors that have a revealed strength (i.e., large Pull Factors and Surpluses) can build on existing markets. For example, a community that has a strong tourism and recreation sector may find that the further promotion of tourism and recreation can have strong positive impacts. In other words, it can be just as valuable to build on existing strengths as it is to address weaknesses.

A four step process then comes to light when considering the analysis presented here.

1. Determine which sectors are strengths and weaknesses based on the relative size of the Pull Factor.
2. This determination should first be based on the county in isolation then in comparison to similar counties.
3. Determine the dollar value of the strength or weaknesses based on the Surplus or Leakage.
4. Identify strategies to build on strengths and address weaknesses.

The challenge here is to use the analysis as an “excuse” or “reason” to engage the community in a conversation about the strengths and weaknesses of local retail and service markets and strategies that can be pursued to build on those strengths and address the weaknesses.

### Looking over Time

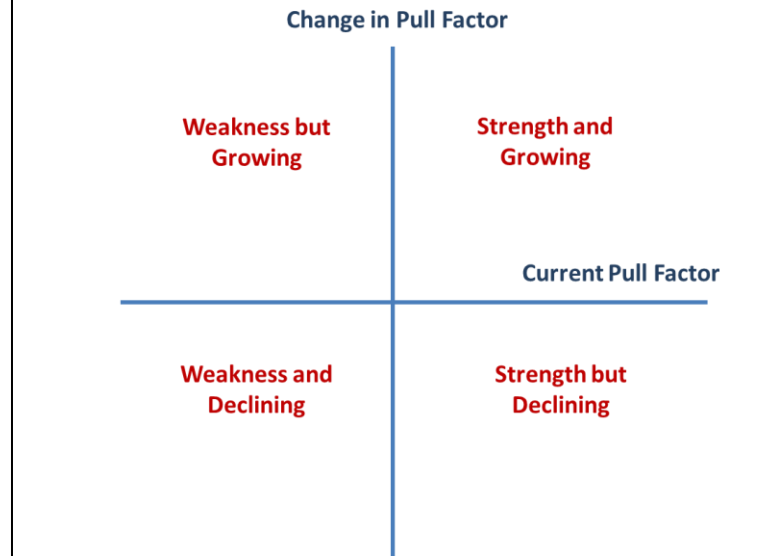

One of the advantages of using the county sales tax as a means to conduct a Trade Area Analysis is that the tax has been in place in numerous counties for a number of years.<sup>2</sup> This allows us to track the performance of local retail and service markets over time. There is, however, a problem: the Wisconsin Department of Revenue has not been consistent in how the data are reported. Staffing limitations have hindered the timeliness of the releases

and changes in the industrial classification systems have changed how the data has been grouped. This latter problem is most evident in the classification of the service sectors. But for retail the ability to compare over time can add an important dimension to community discussions.

There are numerous approaches to conduct comparisons over time but given the range of different metrics developed through Trade Area Analysis it is possible to overwhelm the discussion with too much data. One method to present a significant amount of data in a relatively easy to interpret visual representation is to build on the simple economic cluster analysis offered by Harvard business economist Michael Porter. But rather than looking at location quotient over time and industry sizes we can substitute Pull Factors and size metrics such as Trade Area Captured or Potential Sales. Consider the outline in Figure 1 where we plot the current value of the Pull Factor (horizontal axis) and the Change in the Pull Factor over time (vertical axis).

There are four possible combinations: (1) the Pull Factor is less than one and declining which is the lower left hand quadrant and retail sectors falling into this category could be considered a “weakness and declining”; (2) the Pull Factor is less than one but is increasing over time which is the upper left hand quadrant and could interpreted as a “weakness but growing”; (3) the Pull Factor is great than one, hence a strength, but is declining over time, the lower right hand side quadrant; and finally (4) the Pull Factor is

Figure 1: Cluster Analysis using the Tools of Trade Area Analysis

<sup>2</sup> This includes an analysis of:

2009 (<http://www.aae.wisc.edu/pubs/sps/pdf/stpap550.pdf>)

2006 (<http://www.aae.wisc.edu/pubs/sps/pdf/stpap512.pdf>)

2005 (<http://www.aae.wisc.edu/pubs/sps/pdf/stpap503.pdf>)

2004 (<http://www.aae.wisc.edu/pubs/misc/docs/deller.TAAcounty.%202006.pdf>)

1999 (<http://www.aae.wisc.edu/pubs/sps/pdf/stpap428.pdf>)

Inconsistency in the release of the data by the Department of Revenue has limited the ability to conduct the analysis on a consistent timely annual basis.

greater than one and increasing over time, retail sectors falling into this category would be considered a strength and growing.

From the simple perspective of Michael Porter and economic clusters the industries that might be identified as potential clusters are in the strength and growing or upper right hand quadrant. If sectors like accommodations (hotels, motels and bed and breakfasts) and eating and drinking places are “clustered” in the upper right hand quadrant one could

reasonably concluded that the community could be considered a tourist/recreation dependent market. But for retail, particularly retail businesses that are supporting a local market as opposed to tourism, the weakness but growing and strength but declining quadrants can be equally important for community conservations. In order to construct a visual representation as suggested in Figure 1 I have provided the change in the Pull Factor between 2005 and 2010. This table is the last set of tables before the maps below.

As an example, consider the retail sales analysis for Dane County (Figure 2) and the data that underlies the analysis (Table 3). There are three categories of retail sales that are classified as strength and growing including furniture and home furnishing stores, health and personal care stores, and sporting goods, hobby, book and music stores. This is not completely surprising because of the nature of these particular types of businesses. The notion of market threshold, outlined in detail for Wisconsin counties by Deller and Ryan (1996) and Deller, Kures and Ryan (2006), predicts that “specialty” retail businesses such as these require large concentrations of customers to remain profitable. A market threshold is

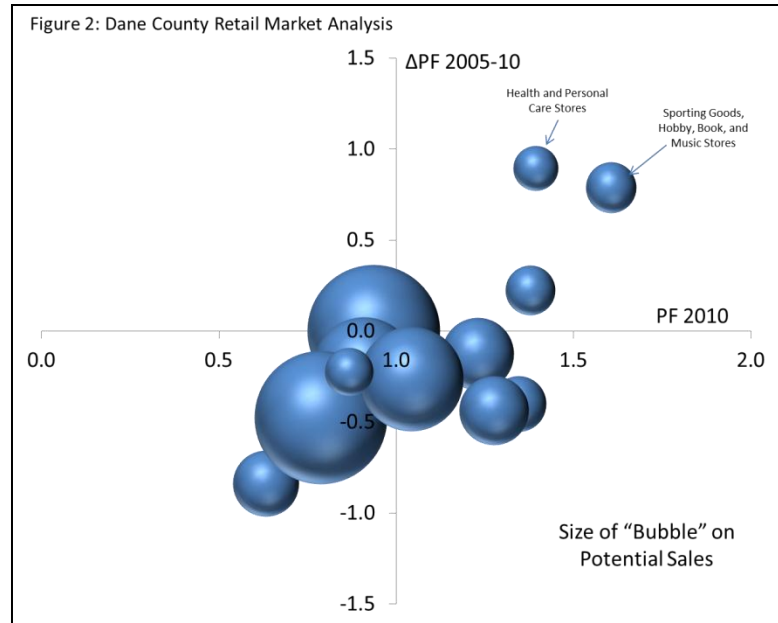

Table 3: Dane County Data for Retail "Cluster" Analysis

	PF 2010	Change PF	PS 2010
Motor Vehicle and Parts Dealers	0.936	0.000	798,654,407
Furniture and Home Furnishings Stores	1.378	0.224	111,576,133
Electronics and Appliance Stores	1.345	-0.401	137,883,562
Building Material and Garden Equipment and Suppli	0.910	-0.205	475,984,066
Food and Beverage Stores	1.231	-0.127	235,559,145
Health and Personal Care Stores	1.393	0.895	91,213,416
Gasoline Stations	0.632	-0.839	196,894,450
Clothing and Clothing Accessories Stores	1.276	-0.437	215,717,260
Sporting Goods, Hobby, Book, and Music Stores	1.606	0.787	115,503,003
General Merchandise Stores	0.788	-0.475	801,421,251
Miscellaneous Store Retailers	1.042	-0.262	495,869,101
Nonstore Retailers	0.867	-0.224	104,277,485

defined very simply as the number of people required to support a particular type of establishment. A simple update of these threshold estimates are provided in Table 4.

Table 4: Market Thresholds for Wisconsin Retail Businesses

	Population Threshold		Population Threshold
Gasoline stations with convenience stores	2,538	Computer and software stores	32,499
Supermarkets and other grocery (except convenience) stores	5,615	All other health and personal care stores	33,069
Other building material dealers	7,060	Boat dealers	33,460
Automotive parts and accessories stores	7,778	Motorcycle, ATV, and personal watercraft dealers	33,861
Pharmacies and drug stores	7,953	Pet and pet supplies stores	34,065
New car dealers	8,947	Paint and wallpaper stores	36,018
Gift, novelty, and souvenir stores	9,033	Food (health) supplement stores	37,449
Radio, television, and other electronics stores	10,511	Mail-order houses	37,698
Sporting goods stores	10,511	Meat markets	40,682
Women's clothing stores	10,896	Convenience stores	40,977
All other general merchandise stores	10,938	Cosmetics, beauty supplies, and perfume stores	40,977
Used car dealers	11,002	Home centers	42,200
Other direct selling establishments	11,153	Office supplies and stationery stores	42,517
Hardware stores	12,622	Outdoor power equipment stores	47,922
Furniture stores	12,707	Sewing, needlework, and piece goods stores	47,922
Shoe stores	13,561	Men's clothing stores	53,347
Jewelry stores	13,561	Art dealers	55,439
Nursery, garden center, and farm supply stores	13,692	Vending machine operators	58,904
Beer, wine, and liquor stores	13,725	Children's and infants' clothing stores	59,524
Florists	14,842	Clothing accessories stores	61,465
Family clothing stores	15,493	Tobacco stores	65,753
All other miscellaneous store retailers (except tobacco stores)	15,708	Recreational vehicle dealers	68,130
Used merchandise stores	15,840	Musical instrument and supplies stores	68,961
All other home furnishings stores	16,930	Baked goods stores	71,579
Floor covering stores	17,399	Warehouse clubs and supercenters	78,539
Other gasoline stations	18,849	Department stores (except discount department stores)	81,953
Tire dealers	23,760	All other motor vehicle dealers	88,356
Optical goods stores	23,760	Confectionery and nut stores	94,246
Electronic shopping	24,586	Manufactured (mobile) home dealers	94,246
Household appliance stores	24,911	Heating oil dealers	99,207
Liquefied petroleum gas (bottled gas) dealers	25,704	Prerecorded tape, compact disc, and record stores	128,518
Hobby, toy, and game stores	27,856	Window treatment stores	182,412
Other clothing stores	28,416	Fruit and vegetable markets	217,491
All other specialty food stores	28,851	Camera and photographic supplies stores	282,739
Book stores	30,732	Fish and seafood markets	471,231
Discount department stores	31,242	Luggage and leather goods stores	565,477

Notice the large number of people to support these more specialized types of establishments. As a result these types of firms are more likely to locate and operate in larger metropolitan areas. A second phenomenon that influences the location and operation of retail establishments is called “agglomeration economies” and is the backbone to the notion of Porter-type economic clusters. Here businesses find that there are synergies that are associated with co-locating near other firms of a similar type. For example, jewelry stores tend to “cluster” in shopping malls along with shoe stores and other specialty stores. The need for a larger local population base along with the powerful influences of agglomeration economies helps explain why these particular category of retail establishments perform so well in a market like Dane County.

Also notice the relative decline in food and beverage stores performance. While the Pull Factor remains above one with a corresponding large surplus the Pull Factor decline by 0.127 between 2005 and 2010. This is partially explained by the expansion of several “super stores” such as super Wal-Marts and Targets which have been aggressively marketing groceries and wine and beer sales. In essence, there has been a shift from traditional grocery stores to these super stores. But also note that at the

same time the Pull Factor for general merchandise stores, which includes these newer super stores, has also declined for Dane County. What might explain this latter decline is the expansion of general merchandise stores, particularly super stores, in other parts of Wisconsin. If that is the case, then Dane County is starting to look more like the state average.

When one triangulates the notions of market thresholds, agglomeration effects and surplus/leakages strong insights into why we observe the patterns that we do. For example, market threshold analysis tells us that large retail leakages in health and personal care stores in smaller more rural markets might be perfectly reasonable and as expected. Thinking in terms of market thresholds also reintroduces the idea that county boundaries may not be reflective of the true spatial boundaries of local retail markets. The concept of the “range” of a good or service is introduced. Here, the “range” is defined as the maximum distance that a consumer might be willing to travel to purchase the good or service. For infrequently purchased or specialty goods or services, such as furniture or hobby shops, people may be willing to travel greater distances. Coupled with agglomeration effects one can see why it is difficult to profitably operate specialty stores in smaller more remote rural communities.

#### Strategies for Enhancing Retail and Service Markets

There exists a wide range of potential strategies can put in place to build on strengths of the local retail and service markets and address potential gaps. A detailed discussion of the vast range of potential strategies is not the intent of this study. Rather, the intent here is to introduce the reader to a broad range of ideas. The two broad classifications of strategies include: (a) increasing the flow of dollars into the community (e.g., build on Surpluses) and (b) increasing the re-circulation of dollars within the community (e.g., plug Leakages). Increasing the flow of dollars into the community means that the community is essentially injecting new money into the local economy by attracting consumers from surrounding communities or by capturing the dollars of visitors to the community. Consumers are both individuals as well as businesses. In each case the community is bringing more money into the community. Increasing the re-circulation of dollars in the community means that the community is plugging Leakages of money out of the local community's economy. In other words, the community is actively seeking ways to get people and businesses to spend more locally.

One can almost think of these as broad approaches to address “gaps” and “disconnects” within the local market. Gaps describe the case where a particular good or service is not available at a sufficient level for purchase in the local community. It may be the case that specific Disconnects are when the goods and services are available but local customers, both residents and businesses, are not making local purchases.

Because these are broad approaches specific strategies will be applicable to both we will suggest several possible specific strategies across both approaches. For a more focused discussion see the monthly newsletter *Lets Talk Business* produced by the Center for Community Economic Development at

the University of Wisconsin-Extension<sup>3</sup> as well as the collection of resources at the USDA National Rural Resource Library and the references therein.<sup>4</sup>

. Examples of specific activities a community can undertake to increase the inflow or re-circulation of dollars include:

1. Develop marketing information to help retail and service businesses in identifying market potentials and formulate business plans.
2. Develop community and regional facilities necessary to attract new retail and service businesses.
3. Expand purchases by non-local people through appropriate advertising and promotions.
  - a. Coordinated advertising can build on economies of size and scope.
  - b. Coordinate business hours.
  - c. Sponsor downtown activities such as sidewalk sales or art fairs.
  - d. Organize farmers markets to attract customers downtown.
  - e. Providing convenient parking or public transit.
4. Ensure that key public services (e.g., fire and police, water and sewer, general administration) are more than satisfactory.
5. Aid businesses in developing employee-training programs to improve quality of service.
6. Work to ensure that retail and service development policies aim at complementary growth where local firms are harmonized and not competitive.
7. Recognizing the important role of transfers such as retirement benefits, and unemployment compensation as a flow of funds into the community.
8. Encourage collective action through the formation of organizations such as Chamber of Commerce or Merchants Association.

These broad based strategies are clearly not exhaustive and are meant to only introduce the notion that strategies can range from the simplistic to the complex. It is also important that there is no one single strategy that effective development of the retail and service sectors require a multi-prong approach with overlapping strategies. Finally, strategies need to be constantly evaluated and adjusted to reflect changing markets.

While the tools of Trade Area Analysis are a powerful indicator of retail and service market strengths and weaknesses, they should not be substituted for detailed business feasibility studies. While businesses have found measures of Surplus and Leakage to be a reasonable first approximation of potential revenues more detailed market analysis is required before specific business investments are made.

## Conclusions

---

<sup>3</sup> <http://www.uwex.edu/ces/cced/publicat/letstalk.html>

<sup>4</sup> <http://www.nal.usda.gov/ric/ricpubs/downtown.html>

The intent of this applied research project is to: (1) introduce one set of tools, specifically Trade Area Analysis, to community development practitioners; (2) apply the tools to a set of data for Wisconsin counties; and (3) outline a set of simple strategies to help build on Surpluses and address Leakages. The tools offered here as well as the analysis should be considered one step in developing a complete understanding of the local retail and service market. Depending on the complexity of the answers being asked, the analysis here can provide a partial answer or help refine the questions for future analysis.
