DAIRY GRAZING FINANCES IN MICHIGAN AND WISCONSIN, 1999

Michigan State University Agricultural Economics Staff Paper No. 2000-54

by Sherrill B. Nott, Tom Kriegl, and William M. Bivens¹ nott@msu.edu

Introduction

The purpose of this paper is to demonstrate possible outcomes and problems of merging farm data sets from multiple states in order to build a statistically sound body of financial information that will help individual farmers analyze their own situations. This paper is in support of a grant titled "Regional/Multi-State Interpretation of Small Farm Financial Data" recently funded by USDA – IFAFS – Farm Efficiency and Profitability.

Financial data sets came from dairy farms using management intensive grazing (MIG) strategies during 1999. There were 12 farms from Michigan and 19 farms from Wisconsin. Finpack and Finansum² were used to process the data from all farms. Definitions and formulas are not given in this paper as they can be found in Finpack users' guides and manuals. The averages for all 31 farms are given in Tables 1 through 10 plus Figures 1 and 2. The averages for farms with less than 70 milk cows are given in Tables 11 through 20. Averages for farms with over 70 cows are in Tables 21 through 30.

Towards the end of the paper is a discussion of the strengths and weaknesses of the data set and what should be considered as more states' data are merged into the grant project. The last page, Table 32, gives some income and expense categories on a per cow basis which may be useful in doing an individual farm comparative analysis.

¹Extension specialist at Michigan State University, farm financial analyst with the Center for Dairy Profitability at the University of Wisconsin, and Michigan Agriculture and Natural Resources agent, respectively. The authors thank the farmers who anonymously provided their data for use in this study.

²Both are from the Center for Farm Financial Management at the University of Minnesota. Finpack provides, among other things, an accrualized financial summary of a farm business. Finansum allows averaging of results from several farms.

Table 1. Livestock Production Summary, 1999 Dairy Graziers in Michigan and Wisconsin (Farms sorted by Net Farm Income)

	Average Of All Farms))))))))))	Average Of Low 25 %	Average Of High 25 %)))))))))))
Dairy			
Number of farms	31	8	8
Avg. number of Cows	80.3	42.9	128.6
Milk produced per Cow	15,953	15,333	17,680
Percent of barn capacity	227.9	162.6	248.0
Avg. milk price per cwt.	15.09	14.94	15.02

The purpose of this paper is to demonstrate the merging of multiple states' dairy farm graziers' financial data. The authors refuse to get into a discussion of Michigan versus Wisconsin, strong though the temptation might be! However, because of the importance of milk price to the financial outcome of specialized dairy farms, the following averages are mentioned to demonstrate how similar the farm situations are between the two states. Table 1 shows the average gross milk price received was \$15.09 per hundredweight (cwt.) on the 31 farms. The average price for the 12 Michigan farms was \$15.16; and the average price on the 19 Wisconsin farms was \$15.03 per cwt.

Table 1 shows that farms in the high 25 percent group, when sorted by net farm income, have more cows than the average of all farms. The low 25 percent by net farm income have fewer cows than the average of all farms. Figure 1 shows a plot of herd size and net farm income for each of the 31 farms in the study. The net farm incomes were calculated in Finpack using market value balance sheet columns, and do not include any changes of land values. Because of the implications that bigger herd size means bigger net income, the 31 farms were split into 2 groups. The 15 farms with 23 to 60 cows were analyzed separately in Tables 11 through 20 below. The 16 farms with 72 to 231 cows were analyzed separately in Tables 21 through 30 below.

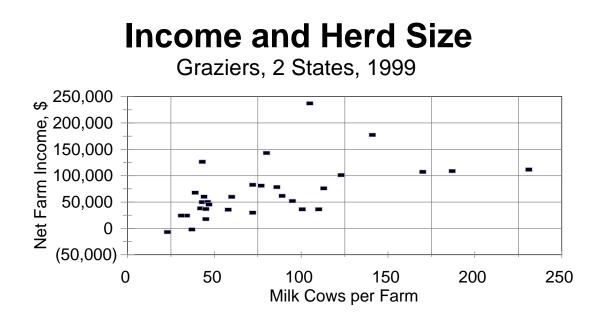

Figure 1.

In the following tables the high and low income percentages were set such that at least 6 farms would be included in each group. This means the percentages are different from the 25 percent levels used in Tables 1 through 10.

Figure 2 below indicates the relationship between net farm income and milk sold per cow for the 31 farms in this study. It appears there may be a weak association between the two factors. However, Table 1 indicated that cow numbers changed proportionately more than did milk per cow when looking at the averages for the low income and high income groups. Consequently, no further analyses were done using milk per cow for a variable as was done in Tables 11 through 30 with herd size.

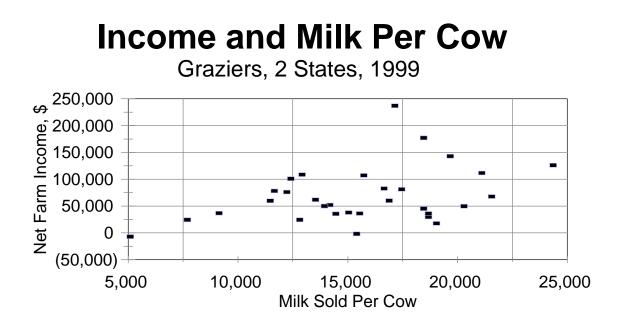

Figure 2.

Strengths and Weakness of Data

The Finansum averaging software will compute land use, crop yields and crop prices. Of the 31 farms in this sample, however, about two thirds did not fully report these items. Hence, no data was presented on these factors. The Finansum system will accept labor inputs and compute a few labor factors, as in Table 9. The factors reported by Finansum are the averages of the 12 farms for which the hours were available. As the project moves forward it will be important to decide which factors are the most important and then assure the data is collected.

Proponents of MIG sometimes argue that the net profit per acre, as opposed to net profit per cow or per farm, is an important financial measure. Because acreage information was missing, the authors could not calculate factors on a per acre basis. However, net farm income from operations per forage acre (NFIFO/A) was calculated in previous years for the Wisconsin farms and compared with other measures of profitability including NFIFO/cow and rate of return on assets (ROROA). The following is from the conclusions of that comparison: "Several measures are needed to accurately judge the financial performance of any business, but under upper Midwest U. S. conditions, dividing by cows is usually more useful than dividing by acres."³

When summarizing a group of profitable and similar enterprise farms, it should not be a surprise that the larger farms are able to make larger net farm incomes. As this project moves forward and the number of participating farms increase, other measures may reveal additional management opportunities. For example, see Table 31. The highest Net Farm Income (NFI/cow) per cow was not in the largest herd size. Herds with 23-60

³ Page 1, "Acres vs. Cows-Comparing Financial Measures," July 1999, By Tom Kriegl.

cows averaged \$932 NFI/cow where herds of 72-231 averaged \$767/NFI/cow. More evaluation is needed to determine if this is a result of how data is handled or if there are management improving strategies with each of the measures per acre, per cow and per farm

The Finansum summaries in this paper were calculated with the option to look at only market value balance sheets. Cost basis columns in the beginning and ending balance sheets were ignored. This means the net farm income levels reported in the above tables include changes in the market values of intermediate and long term assets. The use of market value is discussed here to show the need for consistency in the future as more states' information is merged for analysis. The Wisconsin data did not include cost basis information. Furthermore, as the data was collected in recent years, market values per unit, such as price per acre or per cow, were not allowed to change. During recent years in Michigan, effort was made to input the cost basis inputs to match depreciation schedule values and the prices paid for nondepreciable assets, but farmers set their market prices and were not discouraged from changing them over time.

The strategy for holding market values consistent over time resulted in net farm income on the 19 Wisconsin farms, calculated on the market value basis by Finansum, to average \$64,289 in 1999; changing land values were excluded at the time farm data was input. On the 12 Michigan farms, the average net farm income calculated on the cost basis without market value changes of land averaged \$65,974;⁴ this is, accidently, remarkably similar to the Wisconsin number. The 12 Michigan farms averaged a net farm income of \$126,564 using the Finpack market value calculation which included land value changes. This is nearly twice the Wisconsin level. Most of this difference is due to two factors. First, the Michigan market value data includes appreciation while the Wisconsin data does not. Secondly, the larger size of the average Michigan farm (23 more cows than the Wisconsin data set) would probably result in a larger absolute increase in net worth when asset values are appreciating.

Summary

Dairy farm managers in Michigan and Wisconsin practicing MIG strategies in 1999 appeared to be profitable, on the average. Thirty one panel farms in this study made an average net farm income of \$64,941 using Finpack for calculations and balance sheets with only market value entries. The average net farm income per cow was \$809. When including the change in market values of land, the average net farm income was \$88,395. The average rate of returns on assets was 11.8 percent. See Tables 3 and 6 above.

Table 31 shows the net farm income per cow by groups that were summarized. Table 32, the last page of this paper, is a worksheet with per cow factors and space to enter numbers from your farm.

⁴Page 8, Agricultural Economics Staff Paper No. 2000-33, "Dairy Grazing Farms in Michigan, 1999," by Sherrill B. Nott.

Table 31.	Table 31. NET FARM INCOME PER COW					
Dairy	Dairy Graziers in Michigan and Wisconsin, 1999					
(F	(Farms sorted by Net Farm Income)					
		Average of	Average of	Average of		
		All Farms	Low 25%	<u>High 25%</u>		
All Farms		\$809	\$432	\$1,064		
23 - 60 Cows	5	\$932	\$396	\$1,408		
72 - 231 Cov	/S	\$767	\$437	\$969		

The 31 farms averaged to have 80.3 cows, sold 15,953 pounds of milk per cow, and received a gross milk price of \$15.09 per cwt.

As the future data base of financial performance of dairy farms using MIG is constructed, attention will have to be paid to how market valuations of assets are included in the farm data. Collecting acreage and yields by crops grown may be important.
