#### **ACKNOWLEDGEMENT**

This report was written by the Intensive Grazing Committee consisting of George Conneman, Professor Emeritus, Farm Management; Jason Karszes, Senior Extension Associate, PRO-DAIRY; James Grace, Extension Educator, Steuben, Chemung and Schuyler Counties; Molly Ames, Area Specialist, South Central New York Dairy Team; Ed Staehr, Senior Extension Associate, Applied Economics and Management; Fay Benson, Small Farms Educator, South Central New York Dairy Team; Peggy Murray, Extension Educator, Lewis County; Nancy Glazier, Extension Support Specialist, Northwest New York Team; Virginia Carlberg, Extension Educator, Chautauqua County; Jessica Anderson, Cornell University Work-Study Student; and Linda Putnam, Extension Support Specialist, Charles H. Dyson School of Applied Economics and Management. The committee appreciates the assistance from all the Cornell Cooperative Extension Educators that collected the Dairy Farm Business Summary data, as well as the Extension Educators that collected the grazing practices survey data. The case study provided by Scott and Lin Sawyer and Peggy Murray is appreciated. Thanks also to Brent Tillotson and John Hanchar, Regional Specialist, Northwestern New York Regional Dairy, Livestock, and Field Crops Program, for providing the case study of the Grassland Dairy, Inc.

#### 2009 DAIRY FARM BUSINESS SUMMARY INTENSIVE GRAZING FARMS

#### INTRODUCTION

Dairy farm managers throughout New York State have been participating in Cornell Cooperative Extension's farm business summary and analysis program since the early 1950's. Managers of each participating farm business receive a comprehensive summary and analysis of the farm business.

The farms included in the study are a subset of New York State farms participating in the Dairy Farm Business Summary and Analysis Program (DFBS). Thirty-nine New York farms indicated that they grazed dairy cows at least three months, moving to a fresh paddock at least every three days and more than 30 percent of the forage consumed during the growing season was from grazing. Operators of these 39 farms were asked to complete a grazing practices survey. Sixteen of the farms did complete it. The study centered on 27 New York farms which were not organic farms and were not first year grazers. The "Non-Grazers" are 82 farms with similar herd size to the grazing farms and are compared to the average of the 27 grazing farms.

#### **Program Objective**

The primary objective of the Dairy Farm Business Summary (DFBS) is to help farm managers improve the business and financial management of their business through appropriate use of historical farm data and the application of modern farm business analysis techniques. This information can also be used to establish goals that will enable the business to better meet its objectives. In short, DFBS provides business and financial information needed in identifying and evaluating strengths and weaknesses of the farm business.

#### Format Features

The first section compares intensive grazing farms that participated in the Dairy Farm Business Summary (DFBS) Project in 2008 and 2009. A ten-year comparison is also included this year. The second section of this publication reports data from the grazing practices survey. A comparison of intensive grazing farms with non-grazing farms is included on page 11. The third section, Case Studies, describes two grazing farms. The fourth section summarizes grazing farms by herd size.

The summary and analysis portion of this report follows the same general format as in the 2009 DFBS individual farm report received by all participating dairy farmers. It may be used by any dairy farm manager who wants to compare his or her business with the average data of intensive grazing farms. Non-DFBS participants can download a DFBS Data Check-In Form at <a href="http://dfbs.cornell.edu">http://dfbs.cornell.edu</a>. After collecting data on the form, it can be entered in the U.S. Top Dairies business summary program at the same website to obtain a summary of their business.

The summary and analysis portion of the report features:

- (1) an <u>income statement</u> including accrual adjustments for farm business expenses and receipts, as well as measures of profitability with and without appreciation,
- (2) a complete <u>balance sheet</u> with analytical ratios;
- (3) a <u>statement of owner equity</u> which shows the sources of the change in owner equity during the year;
- (4) a <u>cash flow statement</u> and debt repayment ability analysis;
- (5) an analysis of crop <u>acreage</u>, <u>yields</u>, and <u>expenses</u>;
- (6) an analysis of dairy livestock numbers, production, and expenses; and
- (7) a capital and labor efficiency analysis.

#### PROGRESS OF THE FARM BUSINESS

Comparing your business with average financial data can be helpful in analyzing performance and establishing goals for your business. It is equally important for you to determine the progress your business has made over the past two or three years, to compare this progress to your goals, and to set goals for the future. Please refer to the table on page 3 for selected factors from 20 farms that were grazing in both 2008 and 2009 and participated in the Dairy Farm Business Summary (DFBS) Project for both years.

These 20 farms increased in herd size from 160 cows in 2008 to 165 cows in 2009. Along with the increase in cow numbers, the average number of heifers increased from 127 to 131 head. Although the average number of cows increased the total pounds of milk sold per farm slightly decreased as production per cow fell 554 pounds from 16,289 in 2008 to 15,735 in 2009.

Worker equivalents remained essentially unchanged but with the increase in cow numbers, cows per worker equivalent increased from 47 to 49. However, pounds of milk sold per worker equivalent increased only 3,526 pounds to 770,184 pounds, due to the decrease in production per cow. Labor and machinery costs per cow decreased 13 percent from \$1,365 to \$1,185.

In 2009, some areas of New York State had above average rainfall and other areas had normal rainfall. Overall pasture conditions were good throughout the summer. For these grazing farms, corn yields decreased from 17.7 to 15.2 tons per acre, while hay yields decreased from 2.5 to 2.2 tons per acre.

The amount of investment per cow decreased from 2008's value of \$8,309 to \$8,153 in 2009. This was due to a decrease in value of dairy cattle. Debt per cow in 2009 was \$2,252 and in 2008 it was \$2,267. Farm net worth decreased \$50,450 to \$969,172.

The major factor impacting farm profitability in 2009 was the decrease in the price of milk. It fell from \$19.89 per hundredweight in 2008 to \$14.12 in 2009, a 29 percent decrease. Grazers responded to this decrease by cutting expenses, where possible, in areas of their farm operation. Two major areas cut were grain and fertilizer. Grain expense decreased 16 percent from \$5.63 to \$4.73 per hundredweight. Fertilizer expense, helped by lower prices, decreased 27 percent, from \$1.17 to \$0.86 per hundredweight. dredweight. Total operating expenses decreased \$2.00 or 11 percent, from \$17.89 to \$15.89 per hundredweight. On a per cow basis, milk income decreased more than \$1,000 per cow while expenses decreased only \$413 per cow. This resulted in a decrease in profitability from a net farm income per cow in 2008 of \$630 to a negative \$25 in 2009.

The above factors, when combined, resulted in lower profitability for 2009.

#### **Profitability Measures**

- Net farm income without appreciation decreased from \$100,492 to \$-4,061.
- Net farm income per cow without appreciation decreased from \$630 to \$-25.
- Net farm income with appreciation decreased from \$101,872 to \$1,432.
- Labor and management income per operator decreased from \$27,750 to \$-39,895.
- Rate of return on equity capital without appreciation decreased from 3.2 percent to -7.2 percent.
- Rate of return on all capital with appreciation decreased from 3.5 percent to -4.2 percent.

For both grazers and conventional farms, the year 2009 was not a good year for dairy farmers. The 72 conventional farms with similar herd size as grazing farms, that participated in the DFBS the past two years, had a net farm income without appreciation of negative \$123 per cow, compared to the grazer's net farm income without appreciation of negative \$25 per cow.

The importance of trend analysis is to identify what areas changed, ask why they changed, and look at what you can do differently in the future to influence that change. If you would like help in developing and looking at the trends in your business, contact your local Cornell Cooperative Extension office and become involved in a financial management education program.

**PROGRESS OF THE FARM BUSINESS** Same 20 Grazing Dairy Farms, 2008 & 2009

|  | Average     | Percent   |        |
|--|-------------|-----------|--------|
| Selected Factors                                   | 2008        | 2009      | Change |
|  |             |           |        |
| Size of Business                                   |             |           |        |

#### MYTHS OF GRAZING

Since 1996 Cornell's Agricultural Economics and Management has collected Dairy Farm Business Summary information from grazing dairies. Professor George Conneman has participated with the project since that time. Over the years he has suggested to dairy farmers the possibility of converting their farm to a grazing farm. The responses he has received were sometimes legitimate and some were, as he called them, "The Myths of Grazing". Below are the list of myths and their appropriate responses.

| MYTHS OF GRAZING   | TRUTHS OF GRAZING   |
|--|---|
| A high level of milk production per cow <u>is not</u> important for success of a Management Intensive Grazing (MIG) dairy. | True and FalseAs with confinement herds, production per cow is important, but more important for grazing herd's success is lowering the cost of production per hundredweight.   |
| Grazing is the last thing a dairy farmer does before calling the auctioneer.   | It is true that many grazing dairy farmers arrived at grazing through economic hard times, but this is due more to the inability of farmers to change without feeling economic pain. Many have found success once they decided to change.   |
| A lower set of skills is required to make intensive grazing work.  | Grazing dairies have all the same management issues that confinement herds have with the addition of keeping adequate amounts of pastures through seasons that vary. Management areas such as crop production, herd health, and labor are less stressful due to the adoption of grazing.  |
| MIG is impractical for herds of greater than 100 cows.   | There are many 300+ cow grazing herds, with the maximum in New York around 600 cows. The limiting factor is usually the amount of pasture needed close to the milking area since the cows need to walk for milking twice a day.   |
| Machinery and feed costs are significantly lower on MIG farms.   | The grazing season in New York is only 4-5 months long; this requires the farm to produce the same as a confinement herd the rest of the year. The machinery is doing less acreage per year which will reduce repairs and replacement costs. Substituting pasture for haylage in the cow's diet is beneficial due to the nutrient density of pasture. |
| Putting the cows out to pasture means that the farmer will spend more time chasing escaped cows and fixing fence.          | Over the past 20 years new fencing technologies (mostly from New Zealand) have removed this fear. Many Soil and Water Districts have offered grants to pay for installing these systems.  |
| It only takes grazing skills to make MIG work on dairies.  | As stated earlier, a grazing dairy farmer has the same areas of management to deal with. Their grazing ability is important to make the system work but bottom line is they still operate as a confinement dairy 6-7 months a year.   |

#### INTENSIVE GRAZING SURVEY SUMMARY

From the survey data of the 16 selected grazing farms that completed the grazing practices survey, analysis of average production levels and profitability measures are shown below. Labor and management income per operator per cow without appreciation was used to evaluate whether certain practices contributed favorably to improved profitability. Labor and management income per operator per cow is a measure of the net annual return after the operators' unpaid family labor and an equity charge for capital used in the business has been applied. This is one of the ways to compare diverse businesses that have high debt to those with no debt and those that may rely heavily on unpaid labor with those that have all paid labor. The farms were divided into two groups comprised of the top 50 percent and the lower 50 percent scaled from the highest to lowest labor and management income per operator per cow.

#### SELECTED PRODUCTION AND PROFITABILITY MEASURES

Intensive Grazing Dairy Farms, 2009

|  |            | Average of the | Average of the |
|--|------------|----------------|----------------|
|  | Average    | Top 50%        | Lower 50%      |
|  | (16 farms) | (8 farms)      | (8 farms)      |
| Labor and management income per operator per cow | \$-308     | \$-93          | \$-604         |
| Average number of cows                           | 153        | 177            | 130            |
| Milk sold per cow, pounds                        | 14,531     | 13,739         | 15,613         |
| Operating cost of producing milk per cwt.        | \$12.41    | \$11.85        | \$13.08        |
| Total cost of producing milk per cwt.            | \$19.49    | \$17.58        | \$21.78        |

Comparison of survey data on the various grazing practices, such as water availability, supplemental feeding, pasture species, pasture management, milking system type and frequency of rotation are shown as follows:

Practices to increase pasture quality tended to indicate higher profitability. Those practices included having more grazing experience, rotating pastures more often, use of fertilizer, clipping weeds, re-seeding pasture, and mechanically harvesting pasture before it becomes overgrown.

#### **Breeds**

Holstein was the most common breed with eight of the farms having 95 percent or greater Holstein animals. The second most common were Jersey which were on five farms. Farms with Holstein animals tended to have higher milk production but this year had lower profitability both per cow and per hundredweight.

| Farms that are less than 95% Holstein | 8      | 12,529     | \$-198       | \$-1.58      | 18.0%          |

#### **Supplemental Feeding**

Eleven farms gave detailed ration data and the table below compares the eight farms that fed corn silage to the three that did not. Farms that incorporated corn silage into their grazing forages historically have higher milk production; however, not so this year. These farms did not always have higher profitability. In past years, the feeding of corn silage has shown to be profitable some years and unprofitable others, while supplementation of pasture in general has always shown to be a profitable practice. For a more specific look at what was being fed to these grazing herds, see the following section "Grazing Season Ration Details".

#### **Grazing Season Ration Details**

The five farms in the top 50 percent of profitability fed an average of 12.2 pounds dry matter of grain during the grazing season. Four farms fed corn silage at an average of 8.0 pounds dry matter.

The six farms in the lower 50 percent of profitability fed an average of 11.3 pounds dry matter of grain during the grazing season. Four of the farms fed corn silage at an average of 7.4 pounds dry matter.

#### Frequency of Rotation

Eight of the farms rotated their pastures for milk cows after each milking, four of the farms rotated pasture every day, two farms rotated pasture every other day, and two farms rotated pasture every third day. The table below compares the rotation frequency to milk production and labor and management income per operator per cow.

#### ROTATION FREQUENCY

Intensive Grazing Farms, 2009

|                                 | Top 50%          | (8 farms)      | Lower 50% (8 farms) |                |  |

#### **Water Source**

Six farms provided the majority of water from a well while the remaining eight provided water from a natural source (pond-4 and spring-4).

#### WATER SOURCE

Intensive Grazing Farms, 2009

|  | Top 50%  | (8 farms) | Lower 50% (6 farms) |           |
|--|----------|-----------|---------------------|-----------|
|  | Well (4) | Other (4) | Well (2)            | Other (4) |
| Milk sold per cow, pounds                        | 17,215   | 18,579    | 14,163              | 18,485    |
| Labor and management income per operator per cow | \$-18    | \$-149    | \$-760              | \$-1,024  |

#### Milking System

Farms utilizing some sort of a parlor (herringbone, parallel, rotary, flat barn or other) were separated from those utilizing a pipeline. The type of milking system may impact the degree of control the manager has over the supplemental feeding system and the capital investment level of the farm. In total there were 5 pit parlor systems (no flat parlors) and the remaining 11 farms used pipeline systems.

### MILKING SYSTEM

| Average number of cows                           | 64           | 516        | 46                  | 261        |  |

#### **Commercial Fertilizer**

Nine farms applied fertilizer to the paddocks during the growing season. The majority of farms applied urea and others applied a blended fertilizer. It is not possible to compare pasture yields in the different systems because quantities were not measured from farms that mechanically harvested hay from pasture.

#### **COMMERCIAL FERTILIZER**

#### **Intensive Grazing Satisfaction Comments**

On a scale of 1 to 5, with 5 being the highest, 15 farms responded with the average rating of grazing satisfaction as 4.5 with 8 farms responding 5 (very satisfied) and 7 responding 4 (satisfied). When asked whether their lifestyle has improved with the adoption of rotational grazing, 12 farms responded with all saying "yes".

#### **Grazing Trends**

The table below compares key figures from 1996 (the first year of the intensive grazing summary), 2009, and a 14-year average (not the same farms all 14 years). Cow numbers have increased but milk sold per cow has decreased slightly in recent years due to participation of farms with mixed breeds. Operating cost of producing milk per hundredweight in 2009 averaged \$1.02 above the 14-year average as well as \$1.10 above 1996. Net farm income per cow without appreciation was \$486 lower in 2009 than the 14-year average.

### **2009 GRAZING INFORMATION COMPARED TO 1996 AND 1996 – 2009 AVERAGE**Intensive Grazing Farms, 1996 – 2009

#### **Percent Forage from Pasture**

The following graphs compare the percent forage from pasture to labor and management incomes per operator per cow and pasture acres per cow.

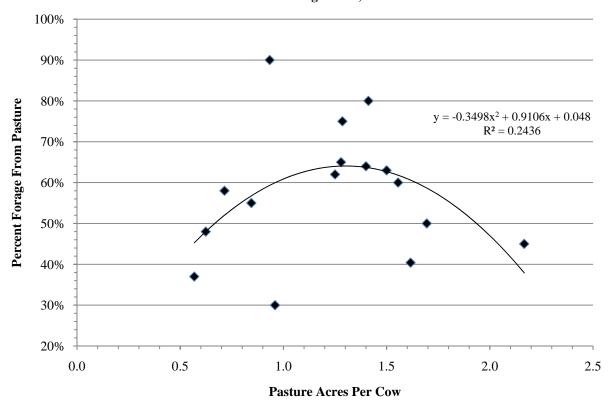

<sup>&</sup>lt;sup>2</sup> In 1996, similar size non-grazers sold 17,547 pounds of milk per cow and in 2009 similar size non-grazers sold 21,946 pounds per cow.

#### **CASE STUDIES**

#### SS Milkyway Farms

SS Milkyway is a 190-cow herd located in the southern end of Lewis County near the Oneida County Border. It is owned by Scott and Lin Sawyer along with their daughter and son-in-law, Charity and Mark Savage. They have a 200-stall 6-row barn built in 1996 with a double-8 parlor built two years later. They use water mattresses and alley scrapers. They grow 240 acres of corn and 300 of hay with 80 acres of hay ground used for grazing. Twenty-five acres have first cutting taken off and then used for grazing. Besides the family, they have two full-time employees and one part-time employee in the summer.

Scott and Lin Sawyer have thought about grazing their 190-cow dairy herd for the past few years, but a trip Scott made to Australia with his son in 2008 really set things into motion. They started talking to their neighbors who have been successfully grazing for years. They watched their operation closely for the past couple of years.

In 2009, Scott and Lin brought their daughter and son-in-law into the operation and it seemed like a perfect time to make the transition. With Mark taking over the management of the herd, it gave Scott more time to implement and manage the grazing. Scott was looking for a new challenge and changing to grazing provided that.

The location and layout of their farm was not conducive to grazing – the cows and water lines go in eight different directions. Three quarters of a mile is the most the cows have to walk. Fellow grazers have been very helpful with the layout of the paddocks and laneways. Scott and Mark also attended tours and pasture walks – this proved to be very beneficial in the decision and implementing process. Buying the land across the road was also instrumental in the decision to graze.

They started with baby steps – in 2008, they started grazing heifers. Scott and Mark used 50 acres of pasture plus 15 acres of cropland. They set up five paddocks and moved heifers from paddock to paddock. In the spring of 2009, they started grazing 50 percent of his herd once a day. By the end of the season they were grazing all 190 head once a day. The year 2009 was a good year to graze in the North Country. Cool summers and adequate rainfall kept the paddocks green all season. Grazing in Southern Lewis County also has its challenges. On average it is 10 degrees colder than most parts of the state and snowfall comes early and stays late.

The cows are averaging 55 pounds of milk per day. Fifty percent of the dry matter intake comes from grazing. As a result the protein and energy at the feed bunk has been drastically reduced. Scott and Mark still feed a TMR to the cows once a day.

They have enjoyed the challenge that the grazing has presented. According to Scott, it's not less work, it's just different. Their next challenge will be field fertility and changing the seedings on the paddocks.

Scott and Mark are glad they made the switch to grazing. The cows look good, costs are lower, and the wear and tear on the equipment, waterbeds and alley scrappers have decreased. But his one suggestion is to always look outside the box.

#### **Grazing At Grassland Dairy**

#### The Farm Business

Material from this section draws from a June 2009, <u>American Agriculturist</u> article about Grassland Dairy by Tom Rivers. Tom titled the article "Milk Plunge Escapee." Some material is updated to 2010.

The Tillotsons (Brent, Polly, and their twin sons) own and operate a certified organic dairy farm in Pavilion, New York, Genesee County. Two thousand nine was the first full year of production. Today, between 100 and 110 Jersey cows are milked in a conventional swing parlor, and the farm has about 90 replacement animals. During the grazing season, dry cows and bred heifers obtain 100 percent of their forage needs from pasture, while milking cows obtain forage needs from pasture and a mixed ration. Milking cows are fed grain, while dry cows receive minerals.

Two hundred sixty acres of rented tillable land meet the forage needs of the herd. No corn silage is grown. All other required feeds are purchased -- corn grain for the milking herd, calf grains, and a mineral batch.

Brent notes that excellent forages, in the form of grown grasses consumed as pasture or as stored baleage, are key to achieving desired results. Rye grass is the primary forage crop, while clovers and orchard grass share the balance. "Clipping pastures 2 to 3 times a year to manage weed pressures," and "Not grazing pastures too tall, because they tend to get knocked down" are mentioned as important practices in Grassland Dairy's overall approach to producing quality forages.

Cows currently produce about 45 to 50 pounds of milk per day. Milk receipts are enhanced beyond a base organic price when butterfat, protein, and quality factors exceed certain levels. The herd currently averages 4.9 percent butterfat, 3.75 percent protein, and somatic cell counts of 120,000.

The decision to produce certified organic milk was driven by Brent's desire for

- a farm that met the family's financial goals, and
- a farm that did not require "too many employees, and too much capital investment."

Milk price volatility in the conventional milk market and the desire to avoid the volatility also affected the decision. Regarding Brent's decision to produce certified organic milk, the article states "... he's relieved – and thankful – he decided to go organic."

#### Current Practices Result from Challenges Faced

#### **Weather Uncertainties**

Brent cites adjusting to weather uncertainties, for example, the dry summer conditions of 2009 and the negative effects on grass growth, as a challenge. In 2009, the first full year of organic production, Brent found himself having to rethink the amount of pasture needed. The decision was to fence off all but 60 of the 260 acres, including extending waterers, to accomplish production goals. Where cows were expected to travel a half mile or less to pastures, the expanded pasture area meant that cows now travelled up to three quarters of a mile to a mile to access pastures.

Currently, 200 acres are fenced. Twenty 350 feet by 400 feet paddocks are for rotational grazing of dairy cows, while about 40 additional acres are for heifers. The balance is fenced, but not set up for paddocks. The current system provides needed flexibility during periods of poor pastures so that adequate forages are available during the season to meet production goals. Brent emphasizes the importance of providing plenty of water. Water is available at every opening, about every 300 feet. "Animals aren't crowding around waterers when they arrive at a paddock."

#### **Fly Pressures**

Fly pressures while cows are on pasture, especially dry cows, and the potential negative consequences for herd health present challenges within the certified organic milk production framework. Regarding fly management, Brent emphasizes the role of allowable vaccinations – "Vaccination protocols – part of a proactive, preventive approach – are high on our list of practices."

#### **Record Keeping**

Record keeping associated with organic certification, including detailed records for animal, paddock movements by day, present challenges. Polly, the farm business' Financial Manager, and Brent do their best to understand the requirements. They work hard to keep records up to date, and try to stay informed about changes, for example, USDA's new organic pasture rule that was issued in early 2010. Their efforts are paying off -- Polly mentions that based upon certifiers' comments, they are doing a good job.

#### *The Future*

In the near future, the Tillotsons look to achieve and maintain a milking herd of about 120 cows maximum. A new heifer, dry cow barn with capacity for 100 animals is also a key piece for keeping the farm viable in terms of obtaining desired results in the future.

Important financial goals include reducing debt.

Brent will always be seeking opportunities to maintain and, or improve pastures via laneway and watering system maintenance and improvements, and via new seedings – all ryegrass is the goal.

#### A Final Thought

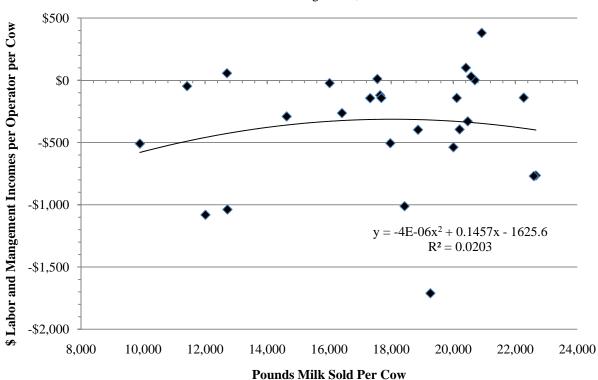

The Tillotson's herd of Jersey cows did not have to make the often difficult transition from conventional confinement housing to a pasture based system. Heifers were started on pasture well prior to the 2008 start date for the dairy, and all animals now entering the milking herd have been on pasture. However, Brent does recognize that in other situations animals need to be taken away from the bunk, learning to eat from pasture. Here, Brent shared the view of intensive grazing expert Don Wild, "Go out to lunch for a few days and let them bellow."

#### SUMMARY OF GRAZING FARMS BY HERD SIZE

There were 12 New York grazing farms with more than 100 cows. Herd size does not guarantee profitability, however, as small farms that are able to produce higher levels of milk per cow also show higher levels of profitability. The chart below shows the variation in labor and management income per operator per cow by pounds of milk sold per cow. The table on the following page compares grazing farms by herd size group.

### LABOR AND MANAGMENT INCOMES PER OPERATOR PER COW AND MILK PER COW

27 Intensive Grazing Farms, 2009

#### SUMMARY AND ANALYSIS OF THE FARM BUSINESS

#### **Business Characteristics**

Planning the optimal management strategies is a crucial component of operating a successful farm. Various combinations of farm resources, enterprises, business arrangements, and management techniques are used by the grazing dairy farmers in New York. The following table shows important farm business characteristics and the number of farms with each characteristic.

#### **BUSINESS CHARACTERISTICS**

27 Intensive Grazing Dairy Farms, 2009

| Type of Farm                  | Number | Milking System                | Number  |
|-------------------------------|--------|-------------------------------|---------|
| Dairy                         | 27     | Bucket & carry                | 0       |
| Part-time dairy               | 0      | Dumping station               | 0       |

The averages used in this report were compiled using data from all the participating grazing dairy farms in New York unless noted otherwise. There are full-time dairy farms, farm renters, partnerships, and corporations included in the average. Average data for these specific types of farms are presented in the State Business Summary.

#### **Income Statement**

In order for an income statement to accurately measure farm income, it must include cash transactions and accrual adjustments (changes in accounts payable, accounts receivable, inventories, and prepaid expenses).

<u>Cash paid</u> is the actual cash outlay during the year and does not necessarily represent the cost of goods and services actually used in 2009.

<u>Change in inventory</u>: Increases in inventories of supplies and other purchased inputs are subtracted in computing accrual expenses because they represent purchased inputs not actually used during the year. Decreases in purchased inventories are added to expenses because they represent inputs purchased in a prior year and used this year.

#### CASH AND ACCRUAL FARM EXPENSES

27 Intensive Grazing Dairy Farms, 2009

|   |                                | Change in Inventory  |    | Change in Accounts | Accrual    |

| Change in prepaid expenses (noted above |                                |                      |    |                    |            |

<u>Change in prepaid expenses</u> (noted above by <<) is a net change in non-inventory expenses that have been paid in advance of their use. For example, prepaid lease expense on the beginning of year balance sheet represents last year's payment for use of the asset during this year. End of year prepaid expense represents payments made this year for next year's use of the asset. Adding payments made last year for this year's use of the asset, and subtracting payments made this year for next year's use of the asset is accomplished by subtracting the difference.

<u>Change in accounts payable</u>: An increase in accounts payable from beginning to end of year is added when calculating accrual expenses because these expenses were incurred (resources used) in 2009 but not paid for. A decrease is subtracted because it represents payment for resources used before 2009.

<u>Accrual expenses</u> are an estimate of the costs of inputs actually used in this year's production. They are the cash paid, less changes in inventory and prepaid expenses, plus accounts payable.

<sup>&</sup>lt;sup>7</sup>Change in advanced government receipts.

<u>Cash receipts</u> include the gross value of milk checks received during the year plus all other payments received from the sale of farm products, services, and government programs. Nonfarm income is not included in calculating farm profitability.

<u>Changes in inventory</u> of assets produced by the business are calculated by subtracting beginning of year values from end of year values <u>excluding appreciation</u>. Increases in livestock inventory caused by herd growth and/or quality are added, and decreases caused by herd reduction and/or quality are subtracted. Changes in inventories of crops grown are also included. An increase in advanced government receipts is subtracted from cash income because it represents income received in 2009 for the 2010 crop year in excess of funds earned for 2009. Likewise, a decrease is added to cash government receipts because it represents funds earned for 2009 but received in 2008.

<u>Changes in accounts receivable</u> are calculated by subtracting beginning year balances from end year balances. Payments in January for milk produced in December 2009 compared to January 2009 payments for milk produced in 2008 are included as a change in accounts receivable.

<u>Accrual receipts</u> represent the value of all farm commodities produced and services actually generated by the farm business during the year.

#### **Profitability Analysis**

Farm operators<sup>9</sup> contribute labor, management, and equity capital to their businesses and the combination of these resources, and the other resources used in the business, determines profitability. Farm profitability can be measured as the return to all family resources or as the return to one or more individual resources such as labor and management.

These measures should be considered estimates as they include inventory values that are only estimates and they include an unknown degree of error stemming from cash flow imbalances.

<sup>&</sup>lt;sup>8</sup>Gifts or inheritances of cattle or crops included in inventory.

Operators are the individuals who are integrally involved in the operation and management of the farm business. They are not limited to those who are the owner of a sole proprietorship or are formally a member of the partnership or corporation.

<u>Net farm income</u> is the return to the farm operators and other unpaid family members for their labor, management, and equity capital. It is the farm family's net annual return from working, managing, and financing the farm business. This is not a measure of cash available from the year's business operation. Cash flow is evaluated later in this report.

Net farm income is computed both with and without appreciation. Appreciation represents the change in values caused by annual changes in prices of livestock, machinery, real estate inventory, and stocks and certificates (other than Farm Credit). Appreciation is a major factor contributing to changes in farm net worth and must be included for a complete profitability analysis.

<sup>&</sup>lt;sup>10</sup>See page 1 for a description of these groups of farms.

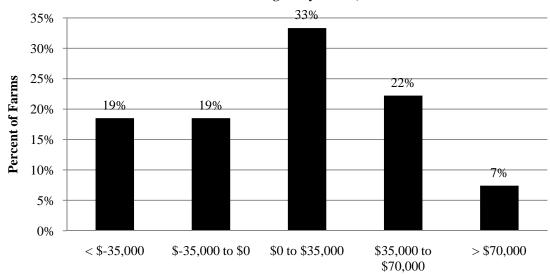

The chart below shows the relationship between net farm income per cow (without appreciation) and pounds of milk sold per cow. Higher new farm incomes can be achieved across a range of production levels as a result of different management systems, such as grazing, being utilized by the participating dairies.

#### NET FARM INCOME PER COW AND MILK PER COW 27 Intensive Grazing Dairy Farms, 2009

<u>Net farm income without appreciation</u> averaged \$-857 on these 27 farms in 2009. The range in net farm income without appreciation was from less than \$-156,400 to more than \$89,300. Net farm income was less than \$0 on 38 percent of the farms, between \$0 and \$70,000 on 55 percent of the farms, while 7 percent had net farm incomes of \$70,000 or more.

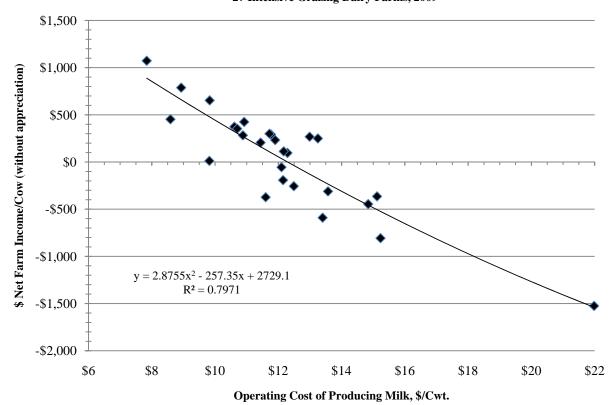

**\$ Net Farm Income Without Appreciation** 

The importance of cost control and its impact on farm profitability are illustrated in the chart below. As the operating cost of producing milk per hundredweight increased, net farm income per cow fell.

### NET FARM INCOME/COW & OPERATING COST OF PRODUCING MILK/CWT. 27 Intensive Grazing Dairy Farms, 2009

<u>Labor and management income</u> is the return which farm operators receive for their labor and management used in the farm business. Appreciation is not included as part of the return to labor and management because it results from ownership of assets rather than management of the farm business. Labor and management income is calculated by deducting a charge for family labor unpaid and the opportunity cost of using equity capital, at a real interest rate of five percent, from net farm income excluding appreciation. The interest charge of five percent reflects the long-term average rate of return above inflation that a farmer might expect to earn in comparable risk investments.

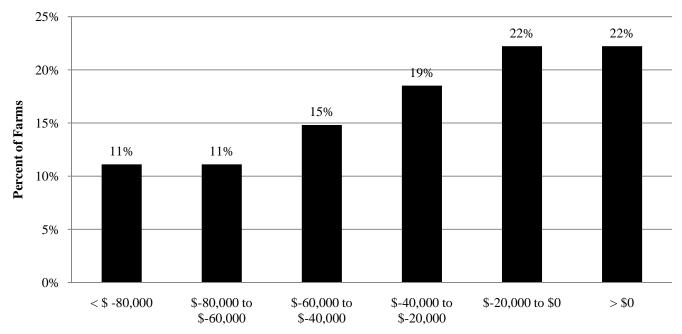

LABOR AND MANAGEMENT INCOME

| Labor & Management Income per Operator per Cow    | \$ -243                                 | \$ -338                                 |

<sup>&</sup>lt;sup>11</sup>See page 1 for a description of these groups of farms.

<u>Labor and management income per operator</u> averaged \$-34,934 on these 27 farms in 2009. The range in labor and management income per operator was from less than \$-218,800 to more than \$18,600. Returns to labor and management were less than \$-60,000 on 22 percent of the farms. Labor and management incomes per operator were between \$-60,000 and \$-20,000 on 34 percent of the farms while 44 percent showed labor and management incomes of \$-20,000 or more per operator.

### DISTRIBUTION OF LABOR & MANAGEMENT INCOMES PER OPERATOR 27 Intensive Grazing Dairy Farms, 2009

\$ Labor and Management Incomes Per Operator

The distribution of labor and management incomes per operator on grazing farms is somewhat similar to the distribution for all farms across the State that participate in the DFBS project. A considerable percentage of farms have labor and management incomes per operator less than zero. One comparison to make to the state distribution is the percentage of farms that were above zero labor and management income per operator. For the intensive grazing farms, 22 percent of the farms had returns that were over zero, while for 205 farms across the State, 8 percent had returns greater than zero in 2009.

Return on equity capital measures the net return remaining for the farmer's equity or owned capital after a charge has been made for the owner-operator's labor and management. The earnings or amount of net farm income allocated to labor and management is the opportunity cost of operators' labor and management estimated by the cooperators. Return on equity capital is calculated with and without appreciation. The rate of return on equity capital is determined by dividing the amount returned by the average farm net worth or equity capital. Return on total capital is calculated by adding interest paid to the return on equity capital and then dividing by average farm assets to calculate the rate of return on total capital. Net farm income from operations ratio is net farm income (without appreciation) divided by total accrual receipts.

<sup>&</sup>lt;sup>12</sup>See page 1 for a description of these groups of farms.

#### **Farm and Family Financial Status**

The first step in evaluating the financial position of the farm is to construct a balance sheet which identifies and values all the assets and liabilities of the business. The second step is to evaluate the relationship between assets, liabilities, and net worth and changes that occurred during the year.

<u>Financial lease</u> obligations are included in the balance sheet. The present value of all future payments is listed as a liability since the farmer is committed to make the payments by signing the lease. The present value is also listed as an asset, representing the future value the item has to the business. For 2009, lease payments were discounted by 8.15 percent to obtain their present value.

Advanced government receipts are included as current liabilities. Government payments received in 2009 that are for participation in the 2010 program are the end year balance and payments received in 2008 for participation in the 2009 program are the beginning year balance.

Current Portion or principal due in the next year for intermediate and long term debt is included as a current liability.

Balance sheet analysis involves examination of relative asset and debt levels for the business. Percent equity is calculated by dividing end of year net worth by end of year assets and multiplying by 100. The debt to asset ratio is compiled by dividing liabilities by assets. Low debt to asset ratios reflect business solvency and the potential capacity to borrow. The leverage ratio is the dollars of debt per dollar of equity, computed by dividing total farm liabilities by farm net worth. Debt levels per productive unit represent old standards that are still useful if used with measures of cash flow and repayment ability. A current ratio that has been falling or is less than 1.5 warrants additional evaluation. An adequate amount of working capital will be related to the size of the farm business.

<u>Farm inventory balance</u> is an accounting of the value of assets used on the balance sheet and the changes that occur from the beginning to end of year. Changes in the livestock inventory are included in the dairy analysis. Net investment indicates whether the capital stock is being expanded (positive) or depleted (negative).

**FARM INVENTORY BALANCE** 27 Intensive Grazing Dairy Farms, 2009

The Statement of Owner Equity has two purposes. It allows (1) verification that the accrual income statement and market value balance sheet are consistent (in accountants terms, they reconcile) and (2) identification of the causes of change in equity that occurred on the farm during the year. The Statement of Owner Equity allows you to determine to what degree the change in equity was caused by (1) earnings from the business, and nonfarm income, in excess of withdrawals being retained in the business (called retained earnings), (2) outside capital being invested in the business or farm capital being removed from the business (called contributed/withdrawn capital), (3) increases or decreases in the value (price) of assets owned by the business (called change in valuation equity), and (4) the error in the business cash flow accounting.

Retained earnings is an excellent indicator of farm generated financial progress.

<sup>&</sup>lt;sup>17</sup>May not add due to rounding.

#### **Cash Flow Statement**

Completing an annual cash flow statement is an important step in understanding the sources and uses of funds for the business. Understanding last year's cash flow is the first step toward planning and managing cash flow for the current and future years.

The <u>annual cash flow statement</u> is structured to show net cash provided by operating activities, investing activities, financing activities and from reserves. All cash inflows and outflows, including beginning and end balances, are included. Therefore, the sum of net cash provided from all four activities should be zero. Any imbalance is the error from incorrect accounting of cash inflows/outflows. You should be aware that all profitability measures may be affected by this error.

#### ANNUAL CASH FLOW STATEMENT

#### **Repayment Analysis**

A valuable use of cash flow analysis is to compare the debt payments planned for the last year with the amount actually paid. The measures listed below provide a number of different perspectives on the repayment performance of the business. However, the critical question to many farmers and lenders is whether planned payments can be made in 2010. The cash flow projection worksheet on the next page can be used to estimate repayment ability, which can then be compared to planned 2010 debt payments shown below.

The <u>coverage ratios</u> measure the ability of the farm business to meet its planned debt payment schedule. The ratios show the percentage of payments planned for 2009 (as of December 31, 2008) that could have been made with the amount available for debt service in 2009. Farmers who did not participate in DFBS in 2008 have their 2009 coverage ratios based on planned debt payments for 2010.

#### **Cropping Analysis**

The cropping program is an important part of the dairy farm business and often represents opportunities for improved productivity and profitability. A complete evaluation of what the available land resources are, how they are being used, how well crops are producing, and what it costs to produce them is important to evaluating alternative cropping and feed purchasing alternatives.

<sup>&</sup>lt;sup>21</sup>This column represents the average acreage for the farms producing that crop. For the 27 Intensive grazing dairy farms, average acreages including those farms not producing were hay crop 186, corn silage 51, corn grain 4, oats 2, wheat 0, tillable pasture 81, and idle 4.

Average crop acres and yields compiled for the grazing farms are for the farms reporting each crop. Yields of forage crops have been converted to tons of dry matter using dry matter coefficients reported by the farmers. Grain production has been converted to bushels of dry grain equivalent based on dry matter information provided.

The following crop/dairy ratios indicate the relationship between forage production, forage production resources, and the dairy herd.

### CROP EXPENSE PER ACRE AND TOTAL FORAGE PRODUCTION PER ACRE 26 Intensive Grazing Dairy Farms, 2009

Most machinery costs are associated with crop production and should be analyzed with the crop enterprise. Total machinery expenses include the major fixed costs (interest and depreciation), as well as the accrual operating costs. Although machinery costs have not been allocated to individual crops, they are shown below per total tillable acre.

ACCRUAL MACHINERY EXPENSES

<sup>&</sup>lt;sup>24</sup>See page 1 for a description of these groups of farms. Excludes farms that do not harvest forages.

#### **Cropping Analysis** (continued)

The charts below show the relationship between the stocking rate (forage and grazing acres per cow) and labor and management income per operator per cow and real estate investment per cow. Stocking rate is total tillable acres plus nontillable pasture acres less corn grain acres, all divided by the average number of cows.

### LABOR AND MANAGEMENT INCOMES/OPERATOR/COW & FORAGE AND GRAZING ACRES/COW

### **Dairy Analysis**

Analysis of the dairy enterprise can reveal strengths and weaknesses of the dairy farm business. Information on this page should be used in conjunction with DHI and other dairy production information. Changes in dairy herd size and market values that occur during the year are identified in the table below. The change in inventory value without appreciation is attributed to physical changes in herd size and quality. Any change in inventory is included as an accrual farm receipt when calculating all of the profitability measures on pages 19 through 22.

<sup>&</sup>lt;sup>25</sup> See page 1 for a description of these groups of farms.

Total milk sold and milk sold per cow are extremely valuable measures of size and productivity, respectively, on the dairy farm. These measures of milk output are based on pounds of milk marketed during the year.

<sup>&</sup>lt;sup>26</sup> See page 1 for a description of these groups of farms.

Monitoring and evaluating culling practices and experiences on an annual basis are important herd management tools. Culling rate can have an effect on both milk per cow and profitability.

The cost of producing milk has been compiled using the whole farm method and is featured in the following table. Accrual receipts from milk sales can be compared with the accrual costs of producing milk per cow and per hundredweight of milk. Using the whole farm method, operating costs of producing milk are estimated by deducting nonmilk accrual receipts from total accrual operating expenses including expansion livestock purchased. Purchased inputs cost of producing milk are the operating costs plus depreciation. Total costs of producing milk include the operating costs of producing milk plus depreciation on machinery and buildings, the value of unpaid family labor, the value of operators' labor and management, and the interest charge for using equity capital.

### **Capital and Labor Efficiency Analysis**

Capital efficiency factors measure how intensively the capital is being used in the farm business. Measures of labor efficiency are key indicators of management's success in generating products per unit of labor input.

### COMPARATIVE ANALYSIS OF THE FARM BUSINESS

### **Progress of the Farm Business**

Comparing your business with average data from regional DFBS cooperators that participated in both of the last two years can be helpful to establishing your goals for these parameters. It is equally important for you to determine the progress your business has made over the past two or three years, to compare this progress to your goals, and to set goals for the future.

### **Grazing Farm Business Chart**

The Farm Business Chart is a tool, which can be used in analyzing your business. Compare your business by drawing a line through or near the figure in each column, which represents your current level of performance. The five figures in each column represent the average of each 20 percent or quintile of farms included in the regional summary. Use this information to identify business areas where more challenging goals are needed.

FARM BUSINESS CHART FOR FARM MANAGEMENT COOPERATORS

### **INCOME AND EXPENSE PROFILES**

Use the following two tables to make an income and expense profile for your dairy farm business. The figures in the quintile columns represent the average of the top 20 percent to the bottom 20 percent for each receipt and expenditure category. Each line is computed independently. The farms that comprise the top 20 percent in milk sales do not necessarily make up the top 20 percent of any other category. On each line circle the income and cost measures closest to the one for your farm. Then draw a vertical line connecting your circles on each table. The strongest profile will be a relatively straight line on the left side of the table.

### RECEIPTS AND EXPENSES PER COW

### SUPPLEMENTARY INFORMATION

Each year DFBS cooperators volunteer to complete supplementary data collection forms looking at selected management aspects of the business or specific research areas being studied. This is in addition to the normal DFBS data collection form. Two areas that were examined this year were the source of dairy replacements and the breakdown of the milk income and marketing expenses. Following is a summary of this information.

### SOURCE OF DAIRY REPLACEMENTS

36 New York Dairy Farms, 2009

| Animals Entering Herd                         | Average |
|---|---------|
| Number calving in 2009 for first time         | 267     |
| Animals purchased, percent <sup>34</sup>      | 3.9%    |
| Animals raised by farm, percent <sup>35</sup> | 96.1%   |
| Current Heifer Inventory                      |         |
| Raised on dairy, percent                      | 86.4%   |
| Raised by a custom grower, percent            | 13.5%   |

<sup>&</sup>lt;sup>34</sup>Animals purchased are animals purchased from a different farm and were not the farm's genetics.

On the average farm, 267 animals calved for the first time in 2009. The breakdown of these animals for source was 3.9 percent purchased and 96.1 percent raised by the farm. Of the current heifer inventory, 86.4 percent were raised on the dairy and 13.5 percent were being raised by a custom grower. There is increased interest in evaluating the dairy replacement enterprise.

### Milk Income and Marketing Expense Breakdown

Starting January 1<sup>st</sup>, 2000, the Northeast switched to multiple components pricing, which changed the format of the milk check and how farmers received payment for their milk. To examine the breakdown of the gross milk income and the marketing expenses, 13 intensive grazing farms filled out a detailed form for all the different sources of income for milk sales and the milk marketing expenses on an accrual basis. This information is reported in the following table. The table is divided into five different areas, each representing a different area of income or expenses.

The first section looks at the value of the milk components on a per cwt. basis. The second area looks at the Producer Price Differential. The third area looks at the premiums a farm receives. Any premiums not specifically noted as quality or volume are included in market premiums. The fourth area looks at the expenses associated with marketing milk. The line item in this section is the expenses associated with utilizing forward contracting or hedging programs to market milk, such as commission or broker fees. The fifth area is the patronage dividends or refunds from the milk cooperative utilizing a monthly deduction from the milk check or a percent of the patronage dividend is treated as a capital purchase and is not a milk marketing expense. The cumulative total for these five areas is the net price received on farms. Your net farm price can be found on page 12 of your farm's DFBS report.

The table on page 43 reports the averages for these different areas.

For your individual farm, compare your accrual numbers following this same format to look at how you compare to other farms in your region and to identify possible areas to generate additional revenue.

<sup>&</sup>lt;sup>35</sup>Animals raised by farm are animals that were born on the farm and entered the herd, which includes animals raised by the farm or custom grower.

## AVERAGE<sup>36</sup> MILK INCOME AND MARKETING REPORT

13 Intensive Grazing Dairy Farms, 2009

<sup>&</sup>lt;sup>36</sup>Each calculation of an average is independent of all others. Therefore, math operations on the detail will not result in the totals. However, detail in the "\$/Cwt of Milk" column will result in the totals.

### **IDENTIFY AND SET GOALS**

If businesses are to be successful, they must have direction. Written goals help provide businesses with an identifiable direction over both the long and short term. Goal setting is as important on a dairy farm as it is in other businesses. Written goals are a tool which farm operators can use to ensure that the business continues to move in the desired direction. Goals should be SMART:

- 1. Goals should be **Specific**.
- 2. Goals should be **M**easurable.
- 3. Goals should be Achievable but challenging.
- 4. Goals should be **Rewarding**.
- 5. Goals should be <u>Timed</u> with a designated date by which the goal will be achieved.

Goal setting on a dairy farm should be a process for writing down and agreeing on goals that you have already given some thought to. It is also important to remember that once you write out your goals they are not cast in concrete. If a change takes place which has a major impact on the farm business, the goals should be reworked to accommodate that change. Refer to your goals as often as necessary to keep the farm business progressing.

It is important to identify both objectives (long-range) and goals (short-range) when looking at the future of your farm business.

A suggested format for writing out your goals is as follows:

- a. Begin with a mission statement which describes why the business exists based on the preferences and values of the owners.
- b. Identify 4-6 objectives.
- c. Identify SMART goals.

### Worksheet for Setting Goals

| I. | Mission and Objectives |
|----|------------------------|
|    |                        |
|    |                        |
|    |                        |
|    |                        |
|    |                        |
|    |                        |
|    |                        |
|    |                        |
|    |                        |

| II. Goals<br>What                                  | How   | When   | Who is Responsible                |
|--|---|--|-----------------------------------|
|  |   |  | r                                 |

### GLOSSARY AND LOCATION OF COMMON TERMS

<u>Accounts Payable</u> - Open accounts or bills owed to feed and supply firms, cattle dealers, veterinarians and other providers of farm services and supplies.

<u>Accounts Receivable</u> - Outstanding receipts from items sold or sales proceeds not yet received, such as the payment for December milk sales received in January.

**Accrual Expenses** - (defined on page 17)

Accrual Receipts - (defined on page 18)

**Annual Cash Flow Statement** - (defined on page 26)

**Appreciation** - (defined on page 19)

<u>Asset Turnover Ratio</u> - The ratio of total farm income to total farm assets, calculated by dividing total accrual operating receipts plus appreciation by average total farm assets.

**Balance Sheet** - A "snapshot" of the business financial position at a given point in time, usually December 31. The balance sheet equates the value of assets to liabilities plus net worth.

<u>Capital Efficiency</u> - The amount of capital invested per production unit. Relatively high investments per worker with low to moderate investments per cow imply efficient use of capital.

<u>Cash From Nonfarm Capital Used in the Business</u> - Transfers of money from nonfarm savings or investments to the farm business where it is used to pay operating expenses, make debt payments and/or capital purchases.

Cash Flow Coverage Ratio - (defined on page 27)

**<u>Cash Paid</u>** - (defined on page 16)

**<u>Cash Receipts</u>** - (defined on page 18)

Change in Accounts Payable - (defined on page 17)

<u>Change in Accounts Receivable</u> - (defined on page 18)

**Change in Inventory** - (defined on page 18)

<u>Cost of Term Debt</u> – A weighted average of the cost of borrowed capital to the farm. Calculate by multiplying end of year principal of each loan that is borrowed by the interest rate for each loan at that time. Add up each amount that is calculated for each loan and then divide by total amount of borrowed funds. Do not include accounts payable, operating debt or advanced government receipts. This information is found on pages 8 & 9 of the data entry form.

Culling Rate – (defined on page 32)

**<u>Current Portion</u>** - (defined on page 22)

<u>Current Ratio</u> – Measures the extent to which current farm assets, if liquidated, would cover current farm liabilities. Calculated as current farm assets at end year divided by current farm liabilities at end year.

<u>Dairy (farm)</u> - A farm business where dairy farming is the primary enterprise, operating and managing this farm is a full-time occupation for one or more people and cropland is owned.

<u>Dairy Cash-Crop (farm)</u> - Operating and managing this farm is the full-time occupation of one or more people, cropland is owned but crop sales exceed 10 percent of accrual milk receipts.

**<u>Debt Coverage Ratio</u>** – (defined on page 27)

**Debt Per Cow** - Total end-of-year debt divided by end-of-year number of cows.

**Debt to Asset Ratios** - (defined on page 24)

**<u>Depreciation Expense Ratio</u>** – Machinery and building depreciation divided by total accrual receipts.

<u>Dry Matter</u> - The amount or proportion of dry material that remains after all water is removed. Commonly used to measure dry matter percent and tons of dry matter in feed.

**Equity Capital** - The farm operator/manager's owned capital or farm net worth.

**Expansion Livestock** - Purchased dairy cattle and other livestock that cause an increase in herd size from the beginning to the end of the year.

<u>Farm Debt Payments as Percent of Milk Sales</u> - Amount of milk income committed to debt repayment, calculated by dividing planned debt payments by total milk receipts. A reliable measure of repayment ability, see page 27.

<u>Farm Debt Payments Per Cow</u> - Planned or scheduled debt payments per cow represent the repayment plan scheduled at the beginning of the year divided by the average number of cows for the year.

<u>Financial Lease</u> - A long-term non-cancelable contract giving the lessee use of an asset in exchange for a series of lease payments. The term of a financial lease usually covers a major portion of the economic life of the asset. The lease is a substitute for purchase. The lessor retains ownership of the asset.

<u>Hired Labor Expense per Hired Worker Equivalent</u> – The total cost to the farm per hired worker equivalent. Divide accrual hired labor expense by number of hired plus family paid worker equivalents.

<u>Hired Labor Expense as % of Milk Sales</u> – The percentage of the gross milk receipts that is used for labor expense. Divide accrual hired labor expense by accrual milk sales.

<u>Income Statement</u> - A complete and accurate account of farm business receipts and expenses used to measure profitability over a period of time such as one year or one month.

<u>Interest Expense Ratio</u> – Accrual interest expense divided by total accrual receipts.

**<u>Labor and Management Income</u>** - (defined on page 21)

<u>Labor and Management Income Per Operator</u> - The return to the owner/manager's labor and management per full-time operator.

**<u>Labor Efficiency</u>** - Production capacity and output per worker.

<u>Leverage Ratio</u> – (defined on page 24)

**Liquidity** - Ability of business to generate cash to make debt payments or to convert assets to cash.

Net Farm Income - (defined on page 19)

**Net Farm Income from Operations Ratio** – (defined on page 22)

<u>Net Milk Receipts</u> – Accrual milk receipts less milk marking expense.

<u>Net Worth</u> - The value of assets less liabilities equal net worth. It is the equity the owner has in owned assets.

Operating Costs of Producing Milk - (defined on page 33)

<u>Operating Expense Ratio</u> – Total accrual expenses less interest and machinery and building depreciation, divided by total accrual receipts.

<u>Opportunity Costs</u> - The cost or charge made for using a resource based on its value in its most likely alternative use. The opportunity cost of a farmer's labor and management is the value he/she would receive if employed in his/her most qualified alternative position.

<u>Other Livestock Expenses</u> - All other dairy herd and livestock expenses not included in more specific categories. Other livestock expenses include DHIC, registration fees and transfers.

<u>Owner/Operator Resources/cwt.</u> - The total value of equity, management, and labor contributed to the farm from all owner/operators. This measure is calculated by adding the interest on equity capital to the value of labor and management for all owner/operators and dividing by the hundredweight produced during the year.

<u>Part-Time Dairy (farm)</u> - Dairy farming is the primary enterprise, cropland is owned but operating and managing this farm is not a full-time occupation for one or more people.

<u>Personal Withdrawals and Family Expenditures Including Nonfarm Debt Payments</u> - All the money removed from the farm business for personal or nonfarm use including family living expenses, health and life insurance, income taxes, nonfarm debt payments, and investments.

<u>Profitability</u> - The return or net income the owner/manager receives for using one or more of his or her resources in the farm business. True "economic profit" is what remains after deducting all the costs including the opportunity costs of the owner/manager's labor, management, and equity capital.

Purchased Inputs Cost of Producing Milk - (defined on page 33)

Renter - Farm business owner/operator owns no tillable land and commonly rents all other farm real estate.

Repayment Analysis - An evaluation of the business' ability to make planned debt payments.

**<u>Replacement Livestock</u>** - Dairy cattle and other livestock purchased to replace those that were culled or sold from the herd during the year.

**Return on Equity Capital** - (defined on page 22)

**Return on Total Capital** - (defined on page 22)

**Solvency** - The extent or ability of assets to cover or pay liabilities. Debt/asset and leverage ratios are common measures of solvency.

**Stocking Rate** – (defined on page 31)

<u>Total Costs of Producing Milk</u> - (defined on page 33)

<u>Total Labor Cost/cwt.</u> - The total cost of all labor used on the farm on a per cwt. basis. The value of unpaid labor at \$2,500 per month plus the value of operator(s) labor at \$2,500 per month plus total hired labor expense divided by the number of cwt. produced.

<u>Whole Farm Method</u> - A procedure used to calculate costs of producing milk on dairy farms without using enterprise cost accounts. All non-milk receipts are assigned a cost equal to their sale value and deducted from total farm expenses to determine the costs of producing milk.

<u>Working Capital</u> – A theoretical measure of the amount of funds available to purchase inputs and inventory items after the sale of current farm assets and payment of all current farm liabilities. Calculated as current farm assets at end year less current farm liabilities at end year.
