2000 DAIRY FARM BUSINESS SUMMARY NORTHERN HUDSON REGION*

INTRODUCTION

Dairy farm managers throughout New York State have been participating in Cornell Cooperative Extension's farm business summary and analysis program since the early 1950's. Managers of each participating farm business receive a comprehensive summary and analysis of their farm business. The information in this report represents averages of the data submitted from dairy farms in the Northern Hudson Region for 2000.

Program Objective

The primary objective of the dairy farm business summary, DFBS, is to help farm managers improve the business and financial management of their business through appropriate use of historical data and the application of modern farm business analysis techniques. This information can also be used to establish goals that enable the business to better fulfill its mission. In short, DFBS provides business and financial information needed in identifying and evaluating strengths and weaknesses of the farm business.

Format Features

This regional report follows the same general format as the 2000 DFBS individual farm report received by participating dairy farmers. The analysis tables have an open column or section labeled <u>My Farm</u>. It may be used by any dairy farm manager who wants to compare his or her business with the average data of this region. The individual farm data, the regional averages and other data can then be used to establish goals for the business. A DFBS Data Check-in Form can be used by non-DFBS participants to summarize their businesses.

This report features:

- (1) an <u>income statement</u> including accrual adjustments for farm business expenses and receipts, as well as measures of profitability with and without appreciation,
- (2) a complete <u>balance sheet</u> with analytical ratios;
- (3) a <u>statement of owner equity</u> which shows the sources of the change in owner equity during the year;
- (4) a <u>cash flow statement</u> and debt repayment ability analysis;
- (5) an analysis of crop <u>acreage</u>, <u>yields</u>, and <u>expenses</u>;
- (6) an analysis of <u>dairy livestock numbers</u>, production, and expenses;
- (7) a <u>capital and labor efficiency</u> analysis; and
- (8) progress of the farm business over the past two years.

^{*}The Northern Hudson Region of New York State, with the number of participating farms in parentheses, is comprised of Albany (5), Saratoga (16), Schenectady (4), Rensselaer (19), Washington (14), and Greene (1) counties. This report was written by George J. Conneman, Professor, Farm Management; Linda D. Putnam was in charge of data preparation. Faye Butts prepared the publication. Farm business data were collected by Cooperative Extension Educators Cathy Wickswat; Sandra Buxton; Dayton Maxwell; and Senior Extension Associate in ProDairy, Jason Karszes.

SUMMARY AND ANALYSIS OF THE FARM BUSINESS

Business Characteristics

Planning optimal management strategies is a crucial component of operating a successful farm. Various combinations of farm resources, enterprises, business arrangements, and management techniques are used by the dairy farmers in this region. The following table shows important farm business characteristics and the number of farms with each characteristic.

Type of Farm	Number	Milking System	Number
Dairy	58	Bucket & carry	0
Part-time dairy	0	Dumping station	1
Dairy cash-crop	1	Pipeline	17
		Herringbone conventional exit	34
Type of Ownership	Number	Herringbone rapid exit	1
Owner	52	Parallel	3
Renter	7	Parabone	0
		Rotary	0
Type of Business	Number	Other	3
Sole Proprietorship	30		
Partnership	23	Production Records	Number
Limited Liability Corporation	3	Testing Service	44
Subchapter S Corporation	2	On Farm System	1
Subchapter C Corporation	1	Other	1
		None	13
Type of Barn	Number		
Stanchion or Tie-Stall	17	bST Usage	Number
Freestall	41	Used on <25% of herd	8
Combination	1	Used on 25-75% of herd	25
		Used on >75% of herd	2
Milking Frequency	Number	Stopped using in 2000	0
2 times per day	45	Not used in 2000	24
3 times per day	9		
Other	5	Business Record System	Number
		Account Book	12
		Accounting Service	16
		On-farm computer	27
		Other	4

BUSINESS CHARACTERISTICS 59 Northern Hudson Region Dairy Farms, 2000

The averages used in this report were compiled using data from all the participating dairy farms in this region unless noted otherwise. There are full-time dairy farms, part-time farms, dairy cash-crop farms, farm renters, partnerships, and corporations included in the average. Average data for these specific types of farms are presented in the State Business Summary.

Income Statement

In order for an income statement to accurately measure farm income, it must include cash transactions and accrual adjustments (changes in accounts payable, accounts receivable, inventories, and prepaid expenses).

<u>Cash paid</u> is the actual cash outlay during the year and does not necessarily represent the cost of goods and services actually used in 2000.

<u>Change in inventory</u>: Increases in inventories of supplies and other purchased inputs are subtracted in computing accrual expenses because they represent purchased inputs not actually used during the year. Decreases in purchased inventories are added to expenses because they represent inputs purchased in a prior year and used this year.

CASH AND ACCRUAL FARM EXPENSES

Building depreciation						10,850
TOTAL ACCRUAL EXPENSES						\$ 491,509

<u>Change in prepaid expenses</u> (noted above by <<) is a net change in non-inventory expenses that have been paid in advance of their use. For example, prepaid lease expense on the beginning of year balance sheet represents last year's payment for use of the asset during this year. End of year prepaid expense represents payments made this year for next year's use of the asset. Adding payments made last year for this year's use of the asset, and subtracting payments made this year for next year's use of the asset is accomplished by subtracting the difference.

<u>Change in accounts payable</u>: An increase in accounts payable from beginning to end of year is added when calculating accural expenses because these expenses were incurred (resources used) in 2000 but not paid for. A decrease is subtracted because it represents payment for resources used before 2000.

<u>Accrual expenses</u> are an estimate of the costs of inputs, except operator/family labor and equity capital, actually used in this year's production. They are the cash paid, less changes in inventory and prepaid expenses, plus accounts payable.

CASH AND ACCRUAL FARM RECEIPTS

59 Northern Hudson Region Dairy Farms, 2000

	Cash	+	Change in	+		Change in Accounts	=	Accrual
Receipt Item	Receipts	Ŧ	Change in Inventory	Ŧ	-	eceivable	_	Receipts
-	· · · ·							
Milk sales	\$ 464,867				\$	5,294		\$ 470,161
Dairy cattle	19,071		\$ 12,198			-214		31,055
Dairy calves	6,737					0		6,737
Other livestock	5,279		273			0		5,551
Crops	3,276		-75			-720		2,480
Government receipts	33,644		0 *			226		33,870
Custom machine work	1,394					0		1,394

Other	5,264					-20		5,243
Less nonfarm noncash capital**	i	(-)	 0 **				(-)	 0
Total Receipts	\$ 539,616		\$ 12,396		\$	4,565		\$ 556,577

*Change in advanced government receipts.

**Gifts or inheritances of cattle or crops included in inventory.

<u>Cash receipts</u> include the gross value of milk checks received during the year plus all other payments received from the sale of farm products, services, and government programs. Nonfarm income is not included in calculating farm profitability.

<u>Changes in inventory</u> of assets produced by the business are calculated by subtracting beginning of year values from end of year values <u>excluding appreciation</u>. Increases in livestock inventory caused by herd growth and/or quality are added, and decreases caused by herd reduction and/or quality are subtracted. Changes in inventories of crops grown are also included. An increase in advanced government receipts is subtracted from cash income because it represents income received in 2000 for the 2001 crop year in excess of funds earned for 2000. Likewise, a decrease is added to cash government receipts because it represents funds earned for 2000 but received in 1999.

<u>Changes in accounts receivable</u> are calculated by subtracting beginning year balances from end year balances. Payments in January 2001 for milk produced in December 2000 compared to January 2000 payments for milk produced in 1999 are included as a change in accounts receivable in determining accrual milk sales.

<u>Accrual receipts</u> represent the value of all farm commodities produced and services actually generated by the farm business during the year.

Profitability Analysis

Farm operators^{*} contribute labor, management, and equity capital to their businesses and the combination of these resources, and the other resources used in the business, determines profitability. Farm profitability can be measured as the return to all family resources or as the return to one or more individual resources such as labor and management.

The return to any individual resource must be viewed as an estimate because the cost of other family resources must be approximated to calculate returns to the selected resource. For example, the costs of operator and family labor and management must be approximated to calculate the returns to equity capital.

^{*} Operators are the individuals who are integrally involved in the operation and management of the farm business. They are not limited to those who are the owner of a sole proprietorship or are formally a member of the partnership or corporation.

<u>Net farm income</u> is the return to the farm operators and other unpaid family members for their labor, management, and equity capital. It is the farm family's net annual return from working, managing, and financing the farm business. This is not a measure of cash available from the year's business operation. Cash flow is evaluated later in this report.

Net farm income is computed both with and without appreciation. Appreciation represents the change in values caused by annual changes in prices of livestock, machinery, real estate inventory, and stocks and certificates (other than Farm Credit). Appreciation is a major factor contributing to changes in farm net worth and must be included for a complete profitability analysis.

NET FARM INCOME

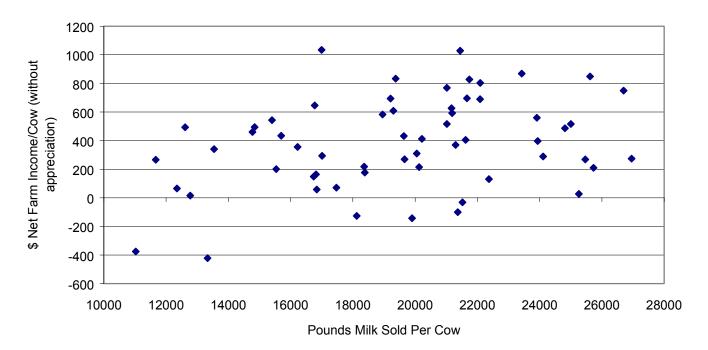

59 Northern Hudson Region Dairy Farms, 2000

	A	verage	<u>1</u>	My Farm
Item	Total	Per Cow	Total	Per Cow
Total accrual receipts	\$ 556,577		\$	
Appreciation: Livestock	5,325		·	
Machinery	140			
Real Estate	6,320			
Other Stock & Certificates	82			
Total Including Appreciation	\$ 568,444		\$	
Total accrual expenses	- 491,509		-	
Net Farm Income (with appreciation)	\$ 76,935	\$ 490	\$	\$
Net Farm Income (without appreciation)	\$ 65,068	\$ 414	\$	\$

The chart below shows the relationship between net farm income per cow (without appreciation) and pounds of milk sold per cow. Generally, farms with a higher production per cow have higher profitability per cow.

NET FARM INCOME/COW AND MILK/COW

59 Northern Hudson Region Dairy Farms, 2000

<u>Labor and management income</u> is the return which farm operators receive for their labor and management used in the farm business. Appreciation is not included as part of the return to labor and management because it results from ownership of assets rather than management of the farm business. Labor and management income is calculated by deducting a charge for unpaid family labor and the opportunity cost of equity capital, at a real interest rate of five percent, from net farm income excluding appreciation. The interest charge of five percent reflects the long-term average rate of return above inflation that a farmer might expect to earn in comparable risk investments.

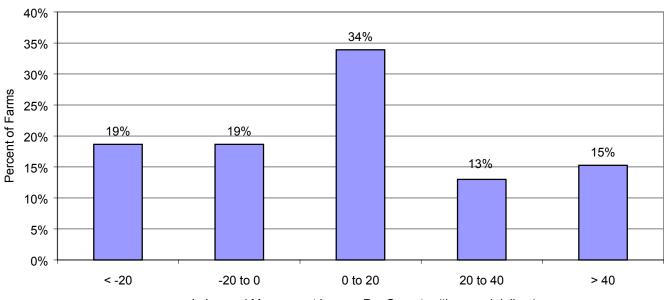

LABOR AND MANAGEMENT INCOME

59 Northern Hudson Region Dairy Farms, 2000

Item	Avera	ge My Farm
Net farm income without appreciation	\$ 65,0	68 \$
Family labor unpaid @ \$1,900 per month	- 7,2	
Interest on \$760,161 average equity capital @ 5% real rate	- 38,0	
Labor & Management Income per farm (1.78 Operators/farm)	\$ 19,8	\$
Labor & Management Income per Operator/Manager	\$ 11,1	46 \$

Labor and management income per operator averaged \$11,146 on these 59 farms in 2000. The range in labor and management income per operator was from less than \$-62,000 to more than \$111,000. Returns to labor and management were negative on 38% of the farms. Labor and management income per operator was between \$0 and \$20,000 on 34% of the farms while 28% showed labor and management incomes of \$20,000 or more per operator.

59 Northern Hudson Region Dairy Farms, 2000

Labor and Mangement Income Per Operator (thousand dollars)

<u>Return on equity capital</u> measures the net return remaining for the farmer's equity or owned capital after a charge has been made for the owner-operator's labor and management. The earnings or amount of net farm income allocated to labor and management is the opportunity cost of operators' labor and management estimated by the cooperators. Return on equity capital is calculated with and without appreciation. The rate of return on equity capital is determined by dividing the amount returned by the average farm net worth or equity capital. <u>Rate of return on total capital</u> is calculated by adding interest paid to the return on equity capital and then dividing by average farm assets. <u>Net farm income from operations ratio</u> is net farm income (without appreciation) divided by total accrual receipts.

RETURN ON EQUITY CAPITAL AND RETURN ON TOTAL CAPITAL

Item	Average	My Farm
Net farm income with appreciation	\$ 76,935	\$
Family labor unpaid @\$1,900 per month	- 7,220

with appreciation	4.5%	%
without appreciation Net Farm Income from Operations Ratio	3.4% 0.12	%

59 Northern Hudson Region Dairy Farms, 2000

Farm and Family Financial Status

The first step in evaluating the financial position of the farm is to construct a balance sheet which identifies and values all the assets and liabilities of the business. The second step is to evaluate the relationship between assets, liabilities, and net worth and changes that occurred during the year.

<u>Financial lease</u> obligations are included in the balance sheet. The present value of all future payments is listed as a liability since the farmer is committed to make the payments by signing the lease. The present value is also listed as an asset, representing the future value the item has to the business. For 2000, lease payments were discounted by 9.75 percent to obtain their present value.

<u>Advanced government receipts</u> are included as current liabilities. Government payments received in 2000 that are for participation in the 2001 program are the end year balance and payments received in 1999 for participation in the 2000 program are the beginning year balance.

Current Portion or principal due in the next year for intermediate and long term debt is included as a current liability.

*Assumes that average nonfarm assets and liabilities for the nonreporting farms were the same as for those reporting.

The following condensed balance sheet, including deferred taxes, contains average data from only those farmers who elected to provide the additional information required to compute deferred taxes. <u>Deferred taxes</u> represent an estimate of the taxes that would be paid if the farm were sold at year end fair market values on the date of the balance sheet. Accuracy is dependent on the accuracy of the market values and the tax basis data provided. Any tax liability for assets other than livestock, machinery, land, buildings and nonfarm assets is excluded. It is assumed that all gain on purchased livestock and machinery is ordinary gain and that listed market values are net of selling costs. The effects of investment tax credit carryover and recapture, carryover of operating losses, alternative minimum taxes and other than average exemptions and deductions are excluded because they have only minor influence on the taxes of most farms. The dramatic impact of including deferred taxes is clear. Total liabilities were increased 58 percent on these 5 farms by including deferred taxes.

Deferred taxes on these farms totaled an average of \$214,846, roughly one-third of the pretax net worth. Percent equity decreased from 63 percent to 41 percent when deferred taxes are included on these farms. When examining net worth, especially as a source of cash for retirement or other purposes, deferred taxes become an important consideration. Deferred taxes in this calculation specify that all assets were sold during one tax year. Therefore, tax management strategies such as making sales in more than one year or installment sales warrant careful consideration to reduce income tax liabilities.

	CONDENSED	BALANCE	SHEET	INCLUDING D	DEFERRED TAXES

December 31, 2000 5 New York Dairy Farms, 2000 <u>Balance sheet analysis</u> involves examination of relative asset and debt levels for the business. Percent equity is calculated by dividing end of year net worth by end of year assets and multiplying by 100. The debt to asset ratio is compiled by dividing liabilities by assets. Low debt to asset ratios reflect business solvency and the potential capacity to borrow. The leverage ratio is the dollars of debt per dollar of equity, computed by dividing total farm liabilities by farm net worth. Debt levels per productive unit represent old standards that are still useful if used with measures of cash flow and repayment ability. A current ratio of less than 1.5 or that has been falling warrants additional evaluation. The amount of working capital that is adequate must be related to the size of the farm business.

Item				Average		My Farm

BALANCE SHEET ANALYSIS 59 Northern Hudson Region Dairy Farms, 2000

<u>Farm inventory balance</u> is an accounting of the value of assets used on the balance sheet and the changes that occur from the beginning to end of year. Changes in the livestock inventory are included in the dairy analysis. Net investment indicates whether the capital stock is being expanded (positive) or depleted (negative).

FARM INVENTORY BALANCE

59 Northern Hudson Region Dairy Farms, 2000

Item	Average of Region's Farms								
	Real Estate	Machinery & Equipment							
Value beginning of year	\$ 445,729	\$ 202,544							
Purchases	\$ 28,759*	\$ 44,465							
Gift & inheritance	+ 0	+ 0							
Lost capital	- 12,416								
Sales	- 129	- 4,691							
Depreciation	- 10,850	- 18,959							
Net investment	= 5,363	= 20,817							
Appreciation	+ 6,320	+ 140							
Value end of year	\$ 457,412	\$ 223,501							

*\$4,763 land and \$23,996 buildings and/or depreciable improvements.

The Statement of Owner Equity has two purposes. It allows (1) verification that the accrual income statement and market value balance sheet are consistent (in accountants terms, they reconcile) and (2) identification of the causes of change in equity that occurred on the farm during the year. The Statement of Owner Equity allows you to determine to what degree the change in equity was caused by (1) earnings from the business, and nonfarm income, in excess of withdrawals being retained in the business (called retained earnings), (2) outside capital being invested in the business or farm capital being removed from the business (called contributed/withdrawn capital), (3) increases or decreases in the value (price) of assets owned by the business (called change in valuation equity), and (4) the error in the business cash flow accounting.

Retained earnings is an excellent indicator of farm generated financial progress.

Cash Flow Statement

Completing an annual cash flow statement is an important step in understanding the sources and uses of funds for the business. Understanding last year's cash flow is the first step toward planning and managing cash flow for the current and future years.

The <u>annual cash flow statement</u> is structured to show net cash provided by operating activities, investing activities, financing activities and from reserves. All cash inflows and outflows, including beginning and end balances, are included. Therefore, the sum of net cash provided from all four activities should be zero. Any imbalance is the error from incorrect accounting of cash inflows/outflows.

ANNUAL CASH FLOW STATEMENT

Repayment Analysis

A valuable use of cash flow analysis is to compare the debt payments planned for the last year with the amount actually paid. The measures listed below provide a number of different perspectives on the repayment performance of the business. However, the critical question to many farmers and lenders is whether planned payments can be made in 2001. The cash flow projection worksheet on the next page can be used to estimate repayment ability, which can then be compared to planned 2001 debt payments shown below.

			Α	verage		My Farm				
		2000 Pa	ayme	nts	Planned	2000 1	Planned

FARM DEBT PAYMENTS PLANNED

Same 51 Northern Hudson Region Dairy Farms, 1999 & 2000

The <u>cash flow coverage ratio</u> and <u>debt coverage ratio</u> measure the ability of the farm business to meet its planned debt payment schedule. The ratios show the percentage of payments planned for 2000 (as of December 31, 1999) that could have been made with the amount available for debt service in 2000. Farmers who did not participate in DFBS in 1999 have their 2000 ratios based on planned debt payments for 2001.

COVERAGE RATIOS

Same 51 Northern Hudson Region Dairy Farms, 1999 & 2000

Item	Average	Item	Average
Cash Flow Coverage Ratio		Debt Coverage Ratio	
Cash farm receipts	\$ 587,344	Net farm income (w/o apprec.)	\$ 70,343

Cropping Analysis

The cropping program is an important part of the dairy farm business and often represents opportunities for improved productivity and profitability. A complete evaluation of what the available land resources are, how they are being used, the level of crop yields, and what it costs to produce crops is important in evaluating alternative cropping and feed purchasing alternatives.

LAND RESOURCES AND CROP PRODUCTION 59 Northern Hudson Region Dairy Farms, 2000

*This column represents the average acreage for the farms producing that crop. Average acreages including those farms not producing were hay crop 218, corn silage 140, corn grain 10, oats 2, tillable pasture 19, and idle 38.

Average crop acres and yields compiled for the region are for the farms reporting each crop. Yields of forage crops have been converted to tons of dry matter using dry matter coefficients reported by the farmers. Grain production has been converted to bushels of dry grain equivalent based on dry matter information provided.

The following crop/dairy ratios indicate the relationship between forage production, forage production resources, and the dairy herd.

CROP/DAIRY RATIOS

Item	Average	My Farm
Total tillable acres per cow	2.78	
Total forage acres per cow	2.32	
Harvested forage dry matter, tons per cow	7.24	

Cropping Analysis (continued)

A number of cooperators have allocated crop expenses among the hay crop, corn, and other crops produced. Fertilizer and lime, seeds and plants, and spray and other crop expenses have been computed per acre and per production unit for hay and corn. Additional expense items such as fuels, labor, and machinery repairs are not included. Rotational grazing was used on 3 farms in the region.

CROP RELATED ACCRUAL EXPENSES Northern Hudson Region Dairy Farms Reporting, 2000

Most machinery costs are associated with crop production and should be analyzed with the crop enterprise. Total machinery expenses include the major fixed costs (interest and depreciation), as well as the accrual operating costs. Although machinery costs have not been allocated to individual crops, they are shown below per total tillable acre.

ACCRUAL MACHINERY EXPENSES

		A	verage		My Farm		
Machinery		Total		Per Till.	Total	Per Till.	
Expense	Expenses		Acre		Expense	s Acre

Total	\$	87,808	\$	200.93	\$	\$	

Dairy Analysis

Analysis of the dairy enterprise can reveal strengths and weaknesses of the dairy farm business. Information on this page should be used in conjunction with DHI and other dairy production information. Changes in dairy herd size and market values that occur during the year are identified in the table below. The change in inventory value without appreciation is attributed to physical changes in herd size and quality. Any change in inventory is included as an accrual farm receipt when calculating all of the profitability measures on pages 6 and 7.

	D	airy Cows				Heifer

DAIRY HERD INVENTORY

59 Northern Hudson Region Dairy Farms, 2000

Total milk sold and milk sold per cow are extremely valuable measures of size and productivity, respectively, on the dairy farm. These measures of milk output are based on pounds of milk marketed during the year.

MILK PRODUCTION

59 Northern Hudson Region Dairy Farms, 2000

Item	Average	My Farm
Total milk sold, lbs.	3,330,060	
Milk sold per cow, lbs.	21,250	
Average milk plant test, percent butterfat	3.77%	

Monitoring and evaluating culling practices and experiences on an annual basis are important herd management tools. Culling rate can have an affect on both milk per cow and profitability.

ANIMALS LEAVING THE HERD

59 Northern Hudson Region Dairy Farms, 2000

		Average		My Farm
Item	Number	Percent*	Percent* Number Percent*	
Cows sold for beef	39	24.8		
Cows sold for dairy	2	1.3		
Cows died	6	3.8		
Culling rate**		28.7		

*Percent of average number of cows in the herd. **Cows sold for beef plus cows died.

<u>The cost of producing milk</u> has been compiled using the whole farm method and is featured in the following table. Accrual receipts from milk sales can be compared with the accrual costs of producing milk per cow and per hundredweight of milk. Using the whole farm method, <u>operating costs of producing milk</u> are estimated by deducting nonmilk accrual receipts from total accrual operating expansion livestock purchased. <u>Purchased inputs cost of producing milk</u> are the operating costs plus depreciation. <u>Total costs of producing milk</u> include the operating costs of producing milk plus depreciation on machinery and buildings, the value of unpaid family labor, the value of operators' labor and management, and the interest charge for using equity capital.

Capital and Labor Efficiency Analysis

Capital efficiency factors measure how effectively the capital is being used in the farm business. Measures of labor efficiency are key indicators of management's success in generating products per unit of labor input. When evaluating a business, the relationship between capital efficiency and labor efficiency should be explored. For example, if capital efficiency shows high capital investment per worker or per cow, labor efficiency should be high reflecting use of capital to make labor more effective. However, if capital investment is high per worker or per cow, and labor efficiency is low, a problem may exist on that farm.

Item		Per Worker	Per Cow	Pe	er Tillable Acre		er Tillable ere Owned

Total	59.3	/ 12 = 4.94 Worker I	Equivalent	
		1.78 Operator/	Manager Equivalent	
<u>My Farm</u> : Total Operator's			er Equivalent tor/Manager Equivaler	nt

Small conventional stall operations of 60 or less cows should strive for labor efficiency of 600,000 or more pounds of milk sold per worker. Large conventional stall operations should strive for 850,000 or more pounds of milk sold per worker. Small free stall operations of less than 300 cows should strive for 1,000,000 pounds of milk sold per worker and large free stall operations with more than 300 cows should strive for over 1,200,000 pounds of milk sold per worker.

Labor costs and machinery costs should also be evaluated both individually and jointly. The more machinery or technology at a worker's disposal, the less time, and therefore cost, that should be required to get work accomplished. Striving for labor and machinery costs per cow of less than \$1,000 on small conventional stall barns, less than \$900 on large conventional stall barns, less than \$850 on small free stall barns and below \$750 on large free stall barns should be a goal.

COMPARATIVE ANALYSIS OF THE FARM BUSINESS

Progress of the Farm Business

Comparing your business with average data from regional DFBS cooperators that participated in both of the last two years can be helpful to establishing your goals for these parameters. It is equally important for you to determine the progress your business has made over the past two or three years, to compare this progress to your goals, and to set goals for the future.

Regional Farm Business Chart

The Farm Business Chart is a tool which can be used in analyzing your business. Compare your business by drawing a line through or near the figure in each column which represents your current level of performance. The five figures in each column represent the average of each 20 percent or quintile of farms included in the regional summary. Use this information to identify business areas where more challenging goals are needed.

*Page number of the participant's DFBS where the factor is located.

Each year DFBS cooperators volunteer to complete supplementary data collection forms looking at selected management aspects of the business or specific research areas being studied. This is in addition to the normal DFBS data collection form. Two areas that were examined this year were the source of dairy replacements and the breakdown of the milk income and marketing expenses. Following is a summary of this information.

91 New Fork Daily	Faims, 2000	
Animals Entering Herd	Average	
Number calving in 2000 for first time Animals purchased, % ¹ Animals raised by farm, % ²	118 17.2 82.8	
Current Heifer Inventory		
Raised on dairy, % Raised by a custom grower, %	81 19	

SOURCE OF DAIRY REPLACEMENTS

91 New York Dairy Farms, 2000

¹ Animals purchased are animals purchased from a different farm and were not the farms genetics.

² Animals raised by farm are animals that were born on the farm and entered the herd, which includes animals raised by the farm or custom grower.

On the average farm, 118 animals calved for the first time in 2000. The breakdown on these animals for source was 17.2% purchased and 82.8% raised by the farm. Of the current heifer inventory, 81% were raised on the dairy and 19% were being raised by a custom grower. There is increased interest in evaluating the dairy replacement enterprise.

Milk Income and Marketing Expense Breakdown

Starting January 1st, 2001, the northeast switched to multiple components pricing, which changed the format of the milk check and how farmers received payment for their milk. To examine the breakdown of the gross milk income and the marketing expenses, 74 farms filled out a detailed form for all the different sources of income for milk sales and the milk marketing expenses on an accrual basis. This information is reported in the following two tables. The tables are divided into six different areas, each representing a different area of income or expenses.

The first section looks at the value of the milk components on a per cwt. basis. The second area looks at the Producer Price Differential. The third area looks at the premiums a farm receives. Any premiums not specifically noted as quality or volume related are included in market premiums. The fourth area looks at the expenses associated with marketing milk. A new line item in this section is the expenses associated with utilizing forward contracting or hedging programs to market milk, such as commission or broker fees. The fifth area is income from the compact program or from forward contracting or hedging programs. The sixth area is the patronage dividends or refunds from the milk cooperatives. Equity purchased in the milk cooperative utilizing a monthly deduction from the milk check or a percent of the patronage dividend is treated as a capital purchase and is not a milk marketing expense. The cumulative total for these six areas is the net price received on farms. Your net farm price can be found on page 10 of your farm's DFBS report.

The table on page 26 reports the averages for these different areas. The table on page 27 contains the range for each of the individual lines of the report. This table is in farm business chart format with each item sorted independently and ranked by fifths. Numbers for the different areas will not add to the totals for that quintile or to the net price received because the highest farms for each item were averaged, not the same farms throughout the six areas. This table shows the range of income and expenses received by farms for all the different areas.

For your individual farm, compare your accrual numbers following this same format to look at how you compare to other farms in your region and to identify possible areas to generate additional revenue.

New York State Farm Business Charts

The Farm Business Chart is a tool which can be used in analyzing a business by drawing a line through the figure in each column which represents the current level of management performance. The figure at the top of each column is the average of the top 10 percent of the 314 farms for that factor. The other figures in each column are the average for the second 10 percent, third 10 percent, etc. Each column of the chart is independent of the others. The farms which are in the top 10 percent for one factor would <u>not</u> necessarily be the same farms which make up the top 10 percent for any other factor.

The cost control factors are ranked from low to high, but the <u>lowest cost is not necessarily the most profitable</u>. In some cases, the "best" management position is somewhere near the middle or average. Many things affect the level of costs, and must be taken into account when analyzing the factors.

Farm Business Charts for farms with freestall barns and 150 cows or less, 151-300 cows, and more than 300 cows; and farms with conventional barns with 60 cows or less and more than 60 cows are shown on pages 33-37.

Financial Analysis Chart

The farm financial analysis chart on page 30 is designed just like the Farm Business Chart and may be used to assess the financial health of the farm business. Most of the financial measures used in the chart are defined on pages 6, 10, 14 and 20 of this publication. References to DFBS output page numbers for participating dairy farmers are provided in the table headings.

*Dollars of debt per dollar of equity, computed by dividing total liabilities by total equity.

**Return on all farm capital (no deduction for interest paid) divided by total farm assets

Comparison by Type of Barn and Herd Size

When analyzing a dairy farm business by comparing it to a group of farms, it is important that the group of farms have used as many of the same physical characteristics as possible as the farm being analyzed. To assist in this endeavor, dairy farms in the summary have been divided into those with freestall and those with conventional housing. Conventional housing includes stanchion and tiestall barns. Within each group, is a further classification by size of the dairy herd.

The table on page 32 includes the average values for the resulting five groups of dairy farms. The average size of farms in the five groups ranges from 47 cows on the small conventional farms to 601 cows on the largest freestall farms.

The largest freestall farms averaged the highest milk output per cow and per worker, the lowest total cost of production and investment per cow, and the greatest returns to labor, management and capital. The large conventional farms showed average profits somewhat higher than the small freestall farm businesses.

Farm business charts have been computed for each of the five housing and herd size categories and are on pages 33-37. By comparing the farm's performance on the most appropriate business chart, a farm manager will be better able to evaluate his or her business performance.

Herd Size Comparisons

A detailed comparison of profitability, financial situation and business analysis factors across herd sizes is contained on pages 46-55 of the 1999 State Summary*. As herd size increases, the average profitability generally increases (page 46)*. Net farm income without appreciation averaged \$ 21,114 per farm for the less than 50 cow farms and \$639,672 per farm for those with 600 cows and over. This relationship generally holds for all measures of profitability including rate of return on capital.

Farm net worth increases rapidly as herd size increases (pages 50-53)*, even though percent equity was higher on the smaller farms. The group with more than 600 cows demonstrated the strongest ability to make debt payments.

Crop yields showed little relationship to herd size, but fertilizer and lime expenses, and machinery cost per tillable acre generally increased as herd size increased (pages 54-55)*. The farms with 600 and more cows per farm averaged 42 percent more milk sold per cow than the smallest farms. All of the groups with 150 or more cows averaged above 20,000 pounds of milk sold per cow while the farms smaller than 150 cows averaged 18,104 pounds of milk sold per cow. Farm capital per worker increased, and farm capital per cow decreased as herd size increased. Milk sold per worker increased dramatically as herd size increased, ranging from 363,719 pounds at the lowest herd size category up to 1,118,658 pounds at the largest size category.

IDENTIFY AND SET GOALS

If businesses are to be successful, they must have direction. Written goals help provide businesses with an identifiable direction over both the long and short term. Goal setting is as important on a dairy farm as it is in other businesses. Written goals are a tool which farm operators can use to ensure that the business continues to move in the desired direction. Goals should be SMART:

- 1. Goals should be Specific.
- 2. Goals should be Measurable.
- 3. Goals should be Achievable but challenging.
- 4. Goals should be <u>Rewarding</u>.
- 5. Goals should be <u>Timed</u> with a designated date by which the goal will be achieved.

Goal setting on a dairy farm should be a process for writing down and agreeing on goals that you have already given some thought to. It is also important to remember that once you write out your goals they are not cast in concrete. If a change takes place which has a major impact on the farm business, the goals should be reworked to accommodate that change. Refer to your goals as often as necessary to keep the farm business progressing.

It is important to identify both objectives (long-range) and goals (short-range) when looking at the future of your farm business.

A suggested format for writing out your goals is as follows:

- a. Begin with a mission statement which describes why the business exists based on the preferences and values of the owners.
- b. Identify 4-6 objectives.
- c. Identify SMART goals.

Worksheet for Setting Goals

I. Mission and Objectives

Worksheet for Setting Goals (Continued)

II. Goals What	How	When	Who is Responsible

Summarize Your Business Performance

The Farm Business and Financial Analysis Charts on pages 24 and 28-30 can be used to help identify strengths and weaknesses of your farm business. Identify three major strengths and three areas of your farm business that need improvement.

Strengths:	1	Needs improvement:

GLOSSARY AND LOCATION OF COMMON TERMS

<u>Accounts Payable</u> - Open accounts or bills owed to feed and supply firms, cattle dealers, veterinarians and other providers of farm services and supplies.

<u>Accounts Receivable</u> - Outstanding receipts from items sold or sales proceeds not yet received, such as the payment for December milk sales received in January.

Accrual Expenses - (defined on page 3)

Accrual Receipts - (defined on page 4)

Annual Cash Flow Statement - (defined on page 12)

Appreciation - (defined on page 5)

<u>Asset Turnover Ratio</u> - The ratio of total farm income to total farm assets, calculated by dividing total accrual operating receipts plus appreciation by average total farm assets.

Balance Sheet - A "snapshot" of the business financial position at a given point in time, usually December 31. The balance sheet equates the value of assets to liabilities plus net worth.

<u>bST</u> Usage</u> - An estimate of the percentage of herd, on average, that was supplemented with bovine somatotropin during the year.

<u>**Capital Efficiency</u>** - The amount of capital invested per production unit. Relatively high investments per worker with low to moderate investments per cow imply efficient use of capital.</u>

<u>Cash From Nonfarm Capital Used in the Business</u> - Transfers of money from nonfarm savings or investments to the farm business where it is used to pay operating expenses, make debt payments and/or capital purchases.

Cash Flow Coverage Ratio - (defined on page 14)

<u>Cash Paid</u> - (defined on page 2)

Cash Receipts - (defined on page 4)

Change in Accounts Payable - (defined on page 3)

<u>Change in Accounts Receivable</u> - (defined on page 4)

<u>Change in Inventory</u> - (defined on page 2)

<u>Cost of Term Debt</u> - A weighted average of the cost of borrowed capital to the farm. Calculate by multiplying end of year principal of each loan that is borrowed by the interest rate for each loan at that time. Add up each amount that is calculated for each loan and then divide by total amount of borrowed funds. Do not include accounts payable, operating debt or advanced gavernment receipts. This information is found on pages 8 & 9 of the data entry form.

<u>Culling Rate</u> - (defined on page 18)

Current Portion - (defined on page 7)

<u>Current Ratio</u> – Measures the extent to which current farm assets, if liquidated, would cover current farm liabilities. Calculated as current farm assets at end year divided by current farm liabilities at end year.

Dairy (farm) - A farm business where dairy farming is the primary enterprise, operating and managing this farm is a full-time occupation for one or more people and cropland is owned.

<u>Dairy Cash-Crop (farm)</u> - Operating and managing this farm is the full-time occupation of one or more people, cropland is owned but crop sales exceed 10 percent of accrual milk receipts.

Debt Coverage Ratio – (defined on page 14)

Debt Per Cow - Total end-of-year debt divided by end-of-year number of cows.

Debt to Asset Ratios - (defined on page 10)

Deferred Taxes - (defined on page 9)

Depreciation Expense Ratio - Machinery and building depreciation divided by total accrual receipts.

Dry Matter - The amount or proportion of dry material that remains after all water is removed. Commonly used to measure dry matter percent and tons of dry matter in feed.

Equity Capital - The farm operator/manager's owned capital or farm net worth.

Expansion Livestock - Purchased dairy cattle and other livestock that cause an increase in herd size from the beginning to the end of the year.

Farm Debt Payments as Percent of Milk Sales - Amount of milk income committed to debt repayment, calculated by dividing planned debt payments by total milk receipts. A reliable measure of repayment ability, see page 14.

Farm Debt Payments Per Cow - Planned or scheduled debt payments per cow represent the repayment plan scheduled at the beginning of the year divided by the average number of cows for the year. This measure of repayment ability is used in the Financial Analysis Chart.

Financial Lease - A long-term non-cancellable contract giving the lessee use of an asset in exchange for a series of lease payments. The term of a financial lease usually covers a major portion of the economic life of the asset. The lease is a substitute for purchase. The lessor retains ownership of the asset.

<u>**Hired Labor Expense per Hired Worker Equivalent**</u> – The total cost to the farm per hired worker equivalent. Divide accrual hired labor expense by number of hired plus family paid worker equivalents.

<u>Hired Labor Expense as % of Milk Sales</u> – The percentage of the gross milk receipts that is used for labor expense. Divide accrual hired labor expense by accrual milk sales.

Income Statement - A complete and accurate account of farm business receipts and expenses used to measure profitability over a period of time such as one year or one month.

Interest Expense Ratio - Accrual interest expense divided by total accrual receipts.

Labor and Management Income - (defined on page 6)

Labor and Management Income Per Operator - The return to the owner/manager's labor and management per fulltime operator.

Labor Efficiency - Production capacity and output per worker.

Leverage Ratio - (defined on page 10)

Liquidity - Ability of business to generate cash to make debt payments or to convert assets to cash.

Net Farm Income - (defined on page 5)

<u>Net Farm Income from Operations Ratio</u> - (defined on page 7)

Net Milk Receipts – Accrual milk receipts less milk marketing expense.

Net Worth - The value of assets less liabilities equal net worth. It is the equity the owner has in owned assets.

Operating Costs of Producing Milk - (defined on page 19)

Operating Expense Ratio – Total accrual expenses less interest and machinery and building depreciation, divided by total accrual receipts.

Opportunity Costs - The cost or charge made for using a resource based on its value in its most likely alternative use. The opportunity cost of a farmer's labor and management is the value he/she would receive if employed in his/her most qualified alternative position.

Other Livestock Expenses - All other dairy herd and livestock expenses not included in more specific categories. Other livestock expenses include; bST, DHIC, registration fees and transfers.

<u>**Part-Time Dairy (farm)</u>** - Dairy farming is the primary enterprise, cropland is owned but operating and managing this farm is not a full-time occupation for one or more people.</u>

<u>Personal Withdrawals and Family Expenditures Including Nonfarm Debt Payments</u> - All the money removed from the farm business for personal or nonfarm use including family living expenses, health and life insurance, income taxes, nonfarm debt payments, and investments.

<u>**Profitability</u>** - The return or net income the owner/manager receives for using one or more of his or her resources in the farm business. True "economic profit" is what remains after deducting all the costs including the opportunity costs of the owner/manager's labor, management, and equity capital.</u>

Purchased Inputs Cost of Producing Milk - (defined on page 19)

Renter - Farm business owner/operator owns no tillable land and commonly rents all other farm real estate.

Repayment Analysis - An evaluation of the business' ability to make planned debt payments.

<u>Replacement Livestock</u> - Dairy cattle and other livestock purchased to replace those that were culled or sold from the herd during the year.

Return on Equity Capital - (defined on page 7)

Return on Total Capital - (defined on page 7)

<u>Solvency</u> - The extent or ability of assets to cover or pay liabilities. Debt/asset and leverage ratios are common measures of solvency.

Total Costs of Producing Milk - (defined on page 19)

<u>Whole Farm Method</u> - A procedure used to calculate costs of producing milk on dairy farms without using enterprise cost accounts. All non-milk receipts are assigned a cost equal to their sale value and deducted from total farm expenses to determine the costs of producing milk.

<u>Working Capital</u> – A theoretical measure of the amount of funds available to purchase inputs and inventory items after the sale of current farm assets and payment of all current farm liabilities. Calculated as current farm assets at end year less current farm liabilities at end year.
