## ACKNOWLEDGEMENT

This report was written by the Intensive Grazing Committee consisting of George Conneman, Professor, Farm Management; Steve Richards, Extension Specialist, Chemung, Cortland, Schuyler, Tioga and Tompkins Counties; Jason Karszes, Senior Extension Associate, PRODAIRY; James Grace, Extension Educator, Steuben County; Janice Degni, Extension Specialist, Chemung, Cortland, Schuyler, Tioga and Tompkins Counties; Steve Bulkley, Extension Specialist, Chemung, Cortland, Schuyler, Tioga and Tompkins Counties; Dan Demaine, Extension Educator, Chemung, Cortland, Schuyler Tioga and Tompkins Counties; Ed Staehr, Extension Educator, Onondaga County; and Linda Putnam, Extension Support Specialist, Farm Management. Faye Butts prepared and distributed the publication. The committee appreciates the assistance from the following Extension Educators that collected the grazing practices survey data: Molly Ames, Karen Baase, Sandy Buxton, Anita Deming, Steve Hadcock, Jackie Hilts, Larry Hulle, Mariane Kiraly, Zaid Kurdieh, Peggy Murray, Carry Oostveen, Joan Petzen, and Bill Van Loo.

## 2000 DAIRY FARM BUSINESS SUMMARY INTENSIVE GRAZING FARMS

## INTRODUCTION

Dairy farm managers throughout New York State have been participating in Cornell Cooperative Extension's farm business summary and analysis program since the early 1950's. Managers of each participating farm business receive a comprehensive summary and analysis of the farm business.

This is the fifth year that a study of intensive grazing farms has been done. The farms included in the study are a subset of New York State farms participating in the Dairy Farm Business Summary (DFBS). Sixty-five farms indicated that they grazed dairy cows at least three months, moving to a fresh paddock at least every three days and more than $30 \%$ of the forage consumed during the growing season was from grazing. Operators of these 65 farms were asked to complete a grazing practices survey. Thirty-eight of the farms did complete it. The investigators had special interest in practices used on farms with above average profitability. Therefore the study centered on 30 farms which were not first year grazers and on which at least 40 percent of forage consumed during the grazing season was grazed. These 30 farms were divided on the basis of net farm income per cow (without appreciation) above and below $\$ 450$ which was the average for these 30 intensive grazing farms. Seventeen farms with net farm income per cow above $\$ 450$ are in the "Above Average" group and thirteen farms with net farm income per cow below $\$ 450$ comprise the "Below Average" group.

## Program Objective

The primary objective of the dairy farm business summary, DFBS, is to help farm managers improve the business and financial management of their business through appropriate use of historical farm data and the application of modern farm business analysis techniques. This information can also be used to establish goals that will enable the business to better meet its objectives. In short, DFBS provides business and financial information needed in identifying and evaluating strengths and weaknesses of the farm business.

## Format Features

The first section compares intensive grazing farms that participated in the Dairy Farm Business Summary project in 1999 and 2000. The second section of this publication reports data from the grazing practices survey. A comparison of intensive grazing farms with non-grazing farms is included on page 7. The third section, Case Studies, describes three New York grazing farms. The fourth section summarizes grazing farms that had more than 100 cows.

The summary and analysis portion of this report follows the same general format as in the 2000 DFBS individual farm report received by all participating dairy farmers. It may be used by any dairy farm manager who wants to compare his or her business with the average data of intensive grazing farms. A DFBS Data Check-in Form can be used by nonDFBS participants to summarize their businesses.

The summary and analysis portion of the report features:
(1) an income statement including accrual adjustments for farm business expenses and receipts, as well as measures of profitability with and without appreciation,
a complete balance sheet with analytical ratios;
a statement of owner equity which shows the sources of the change in owner equity during the year;
a cash flow statement and debt repayment ability analysis;
an analysis of crop acreage, yields, and expenses;
an analysis of dairy livestock numbers, production, and expenses; and
a capital and labor efficiency analysis.

## PROGRESS OF THE FARM BUSINESS

Comparing your business with average financial data from DFBS grazing dairy farms that participated in both of the last two years can be helpful in comparing performance and establishing goals for your business. It is equally important for you to determine the progress your business has made over the past two or three years, to compare this progress to your goals, and to set goals for the future. Please refer to the table on page 3 for selected factors from 47 farms that were grazing in both 1999 and 2000 and participated in the DFBS project for both years.

These 47 farms expanded herd size from 1999 to 2000 by five cows, or 5.4 percent. Along with this herd size increase, worker equivalent increased by 3.7 percent, and nontillable and tillable pasture and hay acres increased 7.1 percent. Milk sold per cow decreased 4.6 percent to 17,401 pounds. This decrease in production offset the increase in herd size; therefore, total milk production shipped off the farm only increased by .4 percent.

With both herd size and worker equivalent increasing, cows per worker equivalent stayed the same. However, again reflecting the decrease in milk sold per cow, milk sold per worker equivalent decreased 3.2 percent. With labor efficiency decreasing, corresponding labor costs increased. Hired labor cost per worker equivalent increased 0.5 percent to $\$ 21,406$. The decrease in labor efficiency coupled with the increase in cost per worker equivalent led to 4.4 percent increase in hired labor expense per cwt. of milk shipped. With this increase in hired labor costs and the decrease in milk price, hired labor cost as a percent of milk sales increased to 10.6 percent.

The 2000 growing season was a different challenge than previous years. With the wet and cool spring many grasses responded well and pasture growth and hay yields were improved over the previous year. Hay yields increased 17.4 percent from 1999. While there was sufficient quantity of pasture, due to the wet and cool spring, the quality was not ideal and was a major contributor to lower milk production per cow. Last year was also a challenging year for corn production, with yields decreasing by 11.2 percent and quality also suffering. This also led to challenges in maintaining milk production once pasture was not utilized anymore.

With the challenging growing conditions and less favorable forage quality, feed costs increased for the year. Grain and concentrate purchased per cwt. increased 3 percent to $\$ 3.43$ per cwt. and dairy feed and crop expense per cwt. increased 1.4 percent. These increases in feed costs coupled with the decrease in milk price led to an increase of 13 percent in the percent of milk check used to purchase grain and concentrate. Total farm operating expenses per cwt. of milked shipped increased 1.6 percent to $\$ 12.63$.

Gross milk price decreased 9.4 percent to $\$ 13.31$ per cwt. and net milk price decreased 11.7 percent to $\$ 12.47$ per cwt. The decrease in milk price coupled with the decrease in milk sold per cow led to a decrease in gross milk sales per cow of 13.8 percent. Dairy cattle sales per cow increased 16.7 percent while dairy calf sales per cow increased 68.2 percent.

The significant decrease in milk price, the decrease in milk sold per cow, and the small increase in operating expense lead to declines in farm profitability.

- Net farm income without appreciation fell 15.5 percent to $\$ 36,918$.
- Net farm income with appreciation fell 4.1 percent to $\$ 51,768$.
- Labor and management income per operator fell 42.2 percent to $\$ 8,185$.
- Rate of return on equity capital without appreciation fell to -0.5 percent.
- Rate of return on all capital without appreciation fell to 1.6 percent.

While profits did decrease from 1999, they were still positive and are reflected in the financial summary of these farms. Net worth increased 4.4 percent, debt per cow increased 1.6 percent to $\$ 1,783$, and debt to asset ratio held steady at . 30 .

Overall, 2000 was a challenging year for the grazing dairy. While on average, profits decreased from 1999, the changes on individual farms varied, with some farms actually doing better in 2000 than in 1999.

The importance of trend analysis is to identify what areas changed, ask why they changed, and look at what you can do differently in the future to influence that change. If you would like help in developing and looking at the trends in your business, contact your local extension service and become involved in a financial management education program.

PROGRESS OF THE FARM BUSINESS
Same 47 Grazing Dairy Farms, 1999 \& 2000

| Selected Factors | Average of 47 Farms |  | Percent <br> Change |
| :---: | :---: | :---: | :---: |
|  | 1999 | 2000 |  |
| Size of Business |  |  |  |
| Average number of cows | 92 | 97 | 5.4 |
| Average number of heifers | 71 | 73 | 2.8 |
| Milk sold, lbs. | 1,681,922 | 1,687,854 | 0.4 |
| Worker equivalent | 2.73 | 2.83 | 3.7 |
| Total nontillable and tillable pasture \& hay acres | 241 | 258 | 7.1 |

| Grain \& conc. purchased as \% of milk sales | 23\% | 26\% | 13.0 |
| Grain \& conc. per cwt. milk | \$3.33 | \$3.43 | 3.0 |
| Dairy feed \& crop expense per cwt. milk | \$4.39 | \$4.45 | 1.4 |
| Labor \& mach. costs per cow | \$1,168 | \$1,125 | -3.7 |
| Total farm operating costs per cwt. sold | \$12.43 | \$12.63 | 1.6 |
| Interest costs per cwt. milk | \$0.67 | \$0.67 | 0.0 |
| Milk marketing costs per cwt. milk sold | \$0.57 | \$0.84 | 47.4 |
| Operating cost of producing cwt. of milk | \$10.71 | \$9.84 | -8.1 |
| Total costs of producing cwt. of milk | \$15.45 | 14.60 | -5.5 |
| Capital Efficiency (average for the year) |  |  |  |
| Farm capital per cow | \$5,942 | \$5,825 | 2.0 |
| Mach. \& equip. per cow | \$1,162 | \$1,163 | 0.1 |
| Asset turnover ratio | 0.53 | 0.51 | -3.8 |
| Income Generation |  |  |  |
| Gross milk sales per cow | \$2,686 | \$2,316 | -13.8 |
| Gross milk sales per cwt. | \$14.69 | \$13.31 | -9.4 |
| Net milk sales per cwt. | \$14.12 | \$12.47 | -11.7 |
| Dairy cattle sales per cow | \$174 | \$203 | 16.7 |
| Dairy calf sales per cow | \$22 | \$37 | 68.2 |
| Profitability |  |  |  |
| Net farm income without appreciation | \$43,695 | \$36,918 | -15.5 |
| Net farm income with appreciation | \$53,962 | \$51,768 | -4.1 |
| Labor \& mgt. income per operator/manager | \$14,152 | \$8,185 | -42.2 |
| Rate of return on equity capital without apprec. | 1.6\% | -0.5\% | -131.3 |
| Rate of return on all capital without apprec. | 3.2\% | 1.6\% | -50.0 |
| Financial Summary |  |  |  |
| Farm net worth, end year | \$386,634 | \$403,610 | 4.4 |
| Debt to asset ratio | 0.30 | 0.30 | 0.0 |
| Farm debt per cow | \$1,755 | \$1,783 | 1.6 |

## INTENSIVE GRAZING SURVEY SUMMARY

Net farm income per cow without appreciation was used this year to evaluate whether certain practices contributed favorably to improved profitability. Net farm income is a measure of the net annual return from working, managing, and financing the farm business. The average net farm income per cow from the 30 selected farms of $\$ 450$ was used to divide the 30 farms into 17 "above average" farms and 13 "below average" farms. Reported below are the average production levels and profitability measures of the 30 selected grazing farms.

## SELECTED PRODUCTION AND PROFITABILITY MEASURES

Intensive Grazing Dairy Farms, 2000

|  | 17 Above <br> Average Farms | 13 Below <br> Average Farms |
| :--- | :---: | :---: |
| Pounds milk sold per cow | 19,075 | 14,808 |
| Net farm income per cow without appreciation | $\$ 692$ | $\$ 44$ |
| Operating cost of producing milk per cwt. | $\$ 8.59$ | $\$ 11.64$ |
| Total cost of production per cwt. | $\$ 13.71$ | $\$ 17.23$ |

Comparison of survey data on the various grazing practices, such as water availability, supplemental feeding, pasture species, pasture management, milking system type and frequency of rotation are shown as follows:

## GRAZING PRACTICES

Intensive Grazing Dairy Farms, 2000

|  | 17 Above <br> Average Farms | 13 Below <br> Average Farms |
| :--- | :---: | :---: |
| Average number of cows | 71 | 126 |
| Percent of farms with seasonal or semi-seasonal calving | $53 \%$ | $31 \%$ |
| Percent of farms with parlor-type milking system | $35 \%$ | $54 \%$ |
| Average percent forage from pasture | $72 \%$ | $75 \%$ |
| Average length of grazing season | 184 | 180 |
| Average pounds dry matter supplemented grain | 14.4 | 12.3 |
| Percent farms supplement with forage | $76 \%$ | $54 \%$ |
| Average pounds dry matter supplemented forage | 11.2 | 9.9 |
| Percent rotated after each milking | $71 \%$ | $62 \%$ |
| Percent rotated one time a day | $18 \%$ | $31 \%$ |
| Percent rotated every other day | $6 \%$ | $7 \%$ |
| Percent other rotation | $5 \%$ | $0 \%$ |
| Percent farms applied fertilizer | $59 \%$ | $30 \%$ |
| Percent farms applied manure to pasture | $53 \%$ | $62 \%$ |
| Percent farms that clipped pasture | $96 \%$ | $92 \%$ |
| Percent farms weed problems | $30 \%$ | $54 \%$ |
| Percent farms water every paddock | $53 \%$ | $77 \%$ |
| Percent farms water every laneway | $47 \%$ | $33 \%$ |
| Average percent pasture that was reseeded in the last 10 years | $35 \%$ | $35 \%$ |
| Percent farms harvested mechanically | $70 \%$ | $85 \%$ |
| Average percent pasture harvested by machine | $42 \%$ | $44 \%$ |
| Most common pasture species: |  |  |
| First | Orchard grass | Orchard grass |
| Second | Native clover | Native clover |
| Third | Ladino clover | Ladino clover |

Seasonal calving, rotating after each milking, supplementing with forage and applying fertilizer all appear to be associated with higher profitability and higher production per cow within the above average group. Some of the farms in the below average group used these same practices. The tables on the next page compare the above average group of farms to the below average group of farms for certain practices. Successful managers of grazing farms need all of the skills for managing the herd in the barn during the winter in addition to grazing management skills.

## Seasonal Calving

The study of the financial data to determine the effect of employing seasonal or semi-seasonal calving on farm profitability shown above was further analyzed. This is the first year that calving practices have been explored. A seasonal herd is where no milking is done for one or more days during the year. A semi-seasonal herd has calving grouped at one or more seasons, and milking is done every day of the year.

SEASONAL CALVING
Intensive Grazing Farms, 2000

|  | 17 Above Average Farms |  | 13 Below Average Farms |  |
| :---: | :---: | :---: | :---: | :---: |
|  | Seasonal or Semi-Seasonal Calving? |  | Seasonal or Semi-Seasonal Calving? |  |
|  | (8) Yes | (9) No | (4) Yes | (9) No |
| Pounds milk sold per cow | 18,560 | 19,258 | 11,827 | 16,557 |
| Net farm income per cow without appreciation | \$820 | \$824 | \$-96 | \$254 |
| Operating cost of producing milk/cwt. | \$8.57 | \$8.23 | \$12.32 | \$10.93 |
| Number of farms strictly seasonal | 1 | -- | 2 | -- |
| Percent of average number of cows when semi-seasonal farms are at lowest number milking | 46\% | -- | 64\% | -- |

## Supplemental Feeding

The table below compares the farms that fed corn silage, grain, and other forage to those that fed only grain and other forage. The farms that fed grain, corn silage, and other forage in both the above average group and below average group had higher labor and management income per operator per cow and pounds of milk sold per cow than the farms that fed only grain and other forage. However, other factors influence the profitability, such as cost of feed. In past years, incorporation of corn silage has been an identified as a forage supplement associated with higher profitability. For a more specific look at what was being fed to these grazing herds, see the following section "Ration Details".

## SUPPLEMENTAL FEEDING

Intensive Grazing Farms, 2000

|  | 17 Above Average Farms |  | 13 Below Average Farms |  |
| :---: | :---: | :---: | :---: | :---: |
|  | (9) Corn Silage | (8) No Corn Silage | (3) Corn Silage | (10) No Corn Silage |
| Net farm income per cow without appreciation | \$707 | \$748 | \$-146 | \$162 |
| Pounds dry matter of grain | 11.5 | 14.3 | 14 | 11.8 |
| Pounds dry matter of corn silage | 7.91 | --- | 10.16 | ----- |
| Pounds dry matter of other forage* | 2.65 | 3.5 | 1 | 4.18 |
| Percent forage from pasture | 50\% | 85\% | 63\% | 68\% |

*Other includes baleage, dry hay, or other forage.

## Ration Details

Of the 17 above average grazing farms (based on net farm income per cow without appreciation), all fed grain during the grazing season. Nine of the farms fed corn silage. None of the farms fed baleage, five farms reported feeding haylage at an average of 6.37 pounds of dry matter per cow per day and four farms reported feeding dry hay at an average of 4.4 pounds of dry matter per cow per day.

Of the 13 below average farms (based on net farm income per cow without appreciation), all fed grain during the grazing season. Three of the farms fed corn silage. None of the farms fed baleage, two farms fed haylage at an average of 13.55 pounds of dry matter per day, and five farms fed dry hay at an average rate of 4 pounds dry matter, one farm fed haylage at an average rate of 7.5 pounds dry matter, and one farm reported feeding other forage with 4 pounds dry matter.

## Frequency of Rotation

In the above average group, 12 farms rotated cows into a fresh paddock after each milking, three farms provided new pasture once per day, one farm moved the cows every other day, and one farm rotated every three days. In the below average group, eight farms rotated cows into a fresh paddock after each milking, four moved the cows to a new pasture one time per day, and one farm provided a fresh paddock every other day. The table below compares the rotation program of cows on new pasture to milk production and net farm income per cow without appreciation.

## ROTATION FREQUENCY

Intensive Grazing Farms, 2000

|  | 17 Above Average Farms |  | 13 Below Average Farms |  |
| :---: | :---: | :---: | :---: | :---: |
|  | Rotation |  | Rotation |  |
|  | (12) After Each Milking | (5) Other | (8) After Each Milking | (5) Other |
| Pounds milk sold per cow | 19,545 | 17,314 | 14,642 | 15,873 |
| Net farm income per cow without appreciation | \$727 | \$719 | \$101 | \$-33 |

## Water Source

There are various options for providing water to pasture. In the above average group, eight farms used a well, three farms used a spring, two farms used a pond, one farm used a stream and two farms used combinations of pond and spring or pond and stream. In the below average group, 10 farms used a well, one farm used a stream, one farm used a pond, and one farm used a combination of a spring and a stream.

## WATER SOURCE

Intensive Grazing Farms, 2000

|  | 17 Above Average Farms |  |  | 13 Below Average Farms |  |
| :--- | ---: | ---: | ---: | ---: | ---: | ---: |
|  | (8) Well | (9) Other |  | (9) Well | (6) Other |
|  | 18,180 | 19,499 |  | 14,043 | 15,178 |
| Pounds milk sold per cow <br> Net farm income per cow without <br> appreciation | $\$ 725$ | $\$ 724$ |  | $\$ 65$ | $\$ 130$ |

*Pond, stream, spring, or combination.

## Milking System

There are several ways to classify milking systems. For the purposes of this analysis, all farms utilizing some sort of a parlor (herringbone, parrabone, rotary, or other) were separated from those utilizing pipeline, dumping station, or bucket and carry system. The type of milking system may impact the degree of control the manager has over the supplemental feeding system. This is the first year that this has been evaluated.

MILKING SYSTEM
Intensive Grazing Farms, 2000

|  | 17 Above Average Farms |  | 13 Below Average Farms |  |
| :---: | :---: | :---: | :---: | :---: |
|  | (6) | (11) | (6) | (7) |
|  | With parlor | Without parlor | With parlor | Without parlor |
| Pounds milk sold per cow | 19,551 | 18,528 | 15,147 | 15,089 |
| Net farm income per cow without appreciation | \$702 | \$737 | \$-98 | \$136 |
| Average number of cows | 106 | 55 | 212 | 65 |
| Operating cost of producing milk/cwt | \$8.75 | \$8.22 | \$12.63 | \$10.50 |

## Commercial Fertilizer

Six farms in the above average group and six farms in the below average group applied fertilizer to the paddocks during the growing season.

COMMERCIAL FERTILIZER
Intensive Grazing Farms, 2000

|  | 17 Above Average Farms |  | 13 Below Average Farms |  |
| :---: | :---: | :---: | :---: | :---: |
|  | (6) | (11) | (6) | (7) |
|  | Applied <br> Fertilizer | Did not apply fertilizer | Applied <br> Fertilizer | Did not apply fertilizer |
| Pounds milk sold per cow | 19,514 | 17,996 | 15,794 | 15,714 |
| Net farm income per cow without appreciation | \$729 | \$718 | \$58 | \$115 |
| Most common product applied | urea | -- | urea | -- |
| Operating cost of producing milk/cwt | \$8.42 | \$8.41 | \$11.60 | \$11.43 |

## Intensive Grazing Satisfaction Comments

On a scale of 1 to 5 , with 5 being the highest, the average rating of grazing satisfaction was 4 . When asked whether their lifestyle has improved with the adoption rotational grazing, all but two indicated their lifestyle has improved Other comments from graziers are:

- "Have grazed for many years."
- "Economically satisfying but more management intensive."
- "We have always pastured from May to October but now we are learning how to get more from our pastures."
- "We likely would not farm any other way."
- "It's nice to have the cows outside."
- "It's the only way to dairy!"

## INTENSIVE GRAZING FARMS VS. NON-GRAZING FARMS

## New York State Dairy Farms, 2000

| Item | All Intensive Grazing Farms* | Non-Grazing <br> Farms** | Profitable <br> Grazing <br> Farms*** | Profitable NonGrazing Farms**** |

## CASE STUDIES

## Sawyer Family Farm

The Sawyer Farm
Matt and Darcy Sawyer have been dairy farming together for 8 years and have used intensive grazing since the beginning. They currently milk about 70 cows on their farm near Locke, New York.

Matt Sawyer started his dairy career as a milk inspector for Sunnydale Farms in 1989. In 1991 Matt met Darcy and they were married in 1992. Darcy was interested in starting a dairy farm, and within two months they started milking cows on a rented farm in Greene, New York. At this location they were milking about 24 cows in a tie stall/stanchion barn with a dump station. The Sawyers quickly decided that this was a lot of work for Darcy, especially with Matt's full-time job at Sunnydale. By early 1993, they had sold the herd of cows and started looking for a new farm site.

In 1994, Matt and Darcy found the ideal site-about 17 acres in Cayuga County. After purchasing the land, they moved a mobile home onto the site and the two set to work building their own freestall barn with a home-made flat barn double 6 parlor. Soon after the barn was completed, Darcy gave birth to their son, Jesse.

As the herd continued to grow, Matt and Darcy built a new double 9 swing parlor in 1998. Matt also decided that he needed to spend more time on the farm and quit his job as a milk inspector in 1999. By 2000, the Sawyers were milking 50 cows on their new farm.

## Grazing

The Sawyers started grazing in Greene, New York because their operation was very labor intensive. The farm they had rented had no silo, so all forage harvested had to be dry hay. Being short of help (Matt still had his full time job) and having old equipment, they decided to turn the cows out after the first hay cutting. Although the pastures were large and the grasses native, the cows did relatively well. In fact, the only problem they encountered that first year was deer running through their pasture fences. The pasture system at this first location consisted of a few large paddocks divided with a single wire.

Since moving to their current location in 1994, the Sawyers have intensified their pasture management. Currently, the pasture is divided into several large subdivisions with the cows being given fresh grass each day. Water is provided to the cows in every paddock and the cows are supplemented with a TMR (consisting of corn silage, corn meal, and a protein supplement) as well as free choice dry hay. They keep track of pasture quality through daily visual assessment that is recorded in their feeding records. They are very satisfied with using pasture and feel that it is a key to their farm's profitability. As their farm has expanded, they have needed to alter their pasture management to meet the herd's needs while maintaining high quality forage. However, grazing will certainly be a part of the farm's future.

## Management Style

Matt and Darcy's mission is to provide a reasonable living for their family by doing what they enjoy mostfarming. They characterize their management style as medium production with low input cost, which includes a very low debt-load. The Sawyers rent most of their land and only own equipment that they use frequently, making use of custom operators for hay and corn harvesting.

Extensive record keeping has allowed the Sawyers to track their progress and make good management decisions. Keeping milk income over feed cost as high as possible is one of their main goals. To achieve this goal, Matt and Darcy record daily milk production and feeding information to calculate their feed costs per hundredweight on a monthly basis. When faced with a management decision, they refer to their records and decide what changes will result in the highest margin possible between milk income and feed costs. While the Sawyers don't find record keeping as one of the most enjoyable aspects of farming, they have found it necessary to make good management decisions.

## Future Goals

Matt and Darcy are very happy with the way things have progressed. Currently, they are striving to make their herd seasonal. Not only will this provide some time off during the winter, but will allow them to manage the cows and calves more efficiently. As of 2001, they have expanded the herd up to 70 cows and plan to stay at this size for the foreseeable future. Matt says, "We credit our success to God's blessing on our efforts."

## Ara-Kuh Farm

History
The name "Ara-Kuh" comes from an area of Delaware County where Tom and Peg Shultz bought their original herd of cows and brought them to Lewis County in 1971. "Kuh" is German for cow.

In 1985, Joe's dad was interested in rotational grazing. Working with Dr. Lucy from the Cornell research center in Chazy, NY, and with help from Joe who was at SUNY Morrisville at the time, they drew up plans for rotational paddocks.

He started with 10 acres of grazing, 10 one-acre paddocks. He was milking 30 cows. In four years he added another 10 acres for a total of 20 one-acre paddocks.

Joe graduated from Cornell University in 1988 and spent one year working on his masters. He then took a job with ASCS in Oswego County. Joe continued to come home weekends to help out on the farm. In 1995, Joe left ASCS and took over the farm.

## Grazing Program

The biggest improvement Joe feels he made was to add black plastic piping to all the paddocks. Before this, he had water vats in the middle and end of the lanes. This allows him to have water available to the cows in every paddock. In 1995, Joe seeded 15 acres with reed canary grass, knowing he would eventually need more pasture. In 1998, he turned these acres into grazing paddocks.

Joe uses one strand of smooth wire on 4 feet of $1 / 2$ rerod. The rerod is sturdy and is easy to pull up and move. He says keeping native pastures works best for him. Most of his
second cutting is grazed.
From May until October he feeds his cows corn silage and about 17 pounds of grain. In the winter he feeds corn silage, grain and a "little bit of dry hay". He ups the grain to 20 pounds. Most years he must supplement the grazing with dry wrapped bales, but in 2000 he did not have to do this. As was the case with all silage, the quality of the grasses was not as good in 2000, but there was plenty.

## Philosophy

Joe definitely is happy with his grazing program. He milks 50 cows and would like to max out at 60 head with 50 milking all the time. He does not want to get any larger. He grazes for a variety of reasons. He enjoys having free time to spend with his wife and infant son. He also likes that he and his wife Sue are able to do all the work themselves. He also enjoys the changes that grazing allows him. He looks forward to letting the cows out in the spring and shortening his barn chores, but also looks forward to bringing them in the barn in the fall and not having to check on the paddocks every day. He knows that he sacrifices production, but his production was 21,000 pounds per cow in 2000 . He also feels his cows are healthier.

## Improvements

Joe would like to be able to have 100-gallon galvanized steel water vats in all the paddocks. Even though he has the water line to all the paddocks, he still has to move the vats. He also knows that he needs to do a better job clipping the pastures. He would like to purchase a mower like the highway department uses. Right now he has to use his hay mower, which is too big, or his brush hog, which is too small.

He keeps up on any new grazing practices by reading, attending programs and talking to other grazers. Joe feels that grazing is the way for him.

## Grazing to Reach Their Goal (Shaklee \& Brown Farm)

Kim Shaklee \& Janice Brown operate a 40-cow grazing dairy adjoining the Keeney Swamp in Birdsall, NY. They operate the farm business with a goal: "Earn a livelihood through agriculture operations with the farm as the sole means of support for their family." With this end in mind, Kim \& Janice are quick to evaluate the marginal return of new methods or projects before embracing them. Participation in the Dairy Farm Business Summary yields financial information that helps with their evaluations.

To achieve their goal Shaklee \& Brown like to make milk when the margin between costs and receipts is maximum. They find it easiest to maximize margin during the grazing season. They try to optimize the relationship between purchased feed and homegrown grazed grass. They plan for most of their herd to be dry during the winter when quality feed is most expensive.

Shaklee \& Brown have participated in the Cornell Dairy Farm Business Summary Program for several years. They appreciate the thoroughness and standardization the program provides for farm records and bench marking. The key factors they like to monitor are listed in the table below along with their farm's performance and the average of all New York grazing farms in the summary.

| Cornell Dairy Farm Business Summary, 2000 |  |  |
| :--- | :---: | :---: |
| Performance Measure | Brown/Shaklee Farm | Average NY Grazing Farms |
| Operating Cost of Production | $\$ 8.02$ | $\$ 10.17$ |
| Asset Turnover Ratio | 0.62 | 0.46 |
| Debt to Asset Ratio | 0.35 | 0.33 |
| Total Farm Debt per Cow | $\$ 1,530$ | $\$ 2,149$ |
| Net Farm Income w/o Appreciation Per Cow | $\$ 677$ | $\$ 310$ |

Their farm is located on highly erodible land in an environmentally sensitive area. Neighboring Keeney Swamp State Wildlife Management Area is a favorite bird watching destination. Kim \& Janice together with Allegany County Bird Club, Cornell Cooperative Extension, New York Pasture Association, Roger Tory Peterson Institute and Shawmut Grasslanders sponsored a spring open house for bird watchers, farmers and others concerned about the ecosystems surrounding the Swamp. The open house provided an opportunity for non-farm people to learn about how grazing enhances the environment.

Shaklee \& Brown's pastures include a diverse mix of grasses. The herd is overwintered outside on a pasture they plan to renovate. The abuse area is re-seeded by overwintering on late cut, seed bearing grass hay bedding. They focus on training cattle to graze a wide range of pasture conditions caused by the constantly changing climatic conditions in Southwestern New York. Temporary fence is used for both perimeter and division fences. Clipping pastures is an exception rather than the norm for Kim and Janice. Clipping is avoided because it creates a bristly stubble that discourages close cropping by the cow, it destroys forage that might be needed in a dry year, and depletes the seed bank of the field. By not clipping, plants have a running start to adapt to changing conditions, animals are enabled to make grazing choices and tall plants with deep roots to share resources with bitten plants through mycorrhizal interaction.

Their feeding program utilizes homegrown grass or purchased hay and a basic grain mix of corn meal, soybean meal and roasted soybeans. Minerals are fed free choice throughout the year. Purchased large hay bales are the winter forage source. During the grazing season, pasture is the sole source of forage for the herd. The amount of soybean meal in the grain mix is adjusted according to pasture quality during the grazing season. They regularly measure the urine pH and manure consistency to determine when the grain mix needs changing. If pH drops below 7 , the percent protein in the grain is increased. If it approaches 9 , the protein level in the grain is dropped.

They utilize cross breeding extensively and are not afraid of milking second generation crosses regardless of which breed they mate back with. About one-third of the herd is straight bred Holstein. In 2000, they sold 16,923 pounds of milk per cow. They prefer to raise their own replacements because they can teach them to graze early. Heifers are pastured from weaning until they are ready to calve.

Kim Shaklee and Janice Brown look at their farm and family as a unit. Decisions in the farming operation are evaluated according to how they will impact the family from financial, moral and lifestyle perspectives. They expect to continue to make capital investments and recognize the need to make capital improvements to the farm business. Kim is always looking for ways to stretch the dollar available to sustain their family in a comfortable lifestyle while relying on the farm to support their family.

## SUMMARY OF GRAZING FARMS WITH OVER 100 COWS

There were 18 farms with more than 100 cows that indicated on the 2000 Dairy Farm Business Summary that they were grazers. The table on the following page compares these 18 grazing farms with 28 non-grazing farms of similar size and location. Surveys were collected from 10 of these 18 large grazing farms.

## Grazing Practices From 10 Grazing Farms With More Than 100 Cows:

- Average length of 2000 grazing season was 184 days.
- Of the ten, 8 moved the cows to a fresh paddock after each milking, 2 moved to a fresh paddock every day.
- All but one of the ten clipped their paddocks at least once a year.
- Six of the farms spread manure on the paddocks, 4 used commercial fertilizer.
- Nine of the farms provided water in every paddock, the other provided it in the laneway.
- Eight of the farms obtained their water from a well, two from a spring.
- The ten farms average $61 \%$ of forage consumption from pasture.
- Eight farms fed some supplemental forage, four fed corn silage.
- Four of the farms had seasonal or semi-seasonal calving.
- They had re-seeded an average of $50 \%$ of the paddocks for grazing.
- Eight of the farms mechanically harvested some of their grazing acreage with an average of $50 \%$ harvested by machine.

Of the ten farms, four indicated the highest level of satisfaction, five the second highest level, and one the third highest level. Six of the farms were more satisfied with grazing than conventional feeding.

## INTENSIVE GRAZING FARMS WITH MORE THAN 100 COWS VS. NON-GRAZING FARMS OF SIMILAR SIZE, 2000

| Item | Grazing Farms $>100$ Cows | Non-Grazing Farms |
| :---: | :---: | :---: |
| Number of farms | 18 | 28 |
| Business Size \& Production |  |  |

## SUMMARY AND ANALYSIS OF THE FARM BUSINESS

## Business Characteristics

Planning the optimal management strategies is a crucial component of operating a successful farm. Various combinations of farm resources, enterprises, business arrangements, and management techniques are used by the grazing dairy farmers in New York. The following table shows important farm business characteristics and the number of farms with each characteristic.

## BUSINESS CHARACTERISTICS

65 Intensive Grazing Dairy Farms, 2000

| Type of Farm | Number | Milking System | Number |
| :---: | :---: | :---: | :---: |
| Dairy | 65 | Bucket \& carry | 0 |
| Part-time dairy | 0 | Dumping station | 1 |
| Dairy cash-crop | 0 | Pipeline | 42 |
|  |  | Herringbone-conventional exit | 9 |

| Freestall | 21 | Used on $25-75 \%$ of herd | 9 |
| Combination | 3 | Used on $>75 \%$ of herd | 2 |
|  |  | Stopped using in 2000 | 3 |
| Milking Frequency | Number | Not used in 2000 | 47 |
| 2 times per day | 61 |  |  |
| 3 times per day | 2 | Business Record System | Number |
| Other | 2 | Account Book | 22 |
|  |  | Accounting Service | 8 |
|  |  | On-farm computer software | 34 |
|  |  | Other | 1 |

The averages used in this report were compiled using data from all the participating grazing dairy farms in New York unless noted otherwise. There are full-time dairy farms, farm renters, partnerships, and corporations included in the average. Average data for these specific types of farms are presented in the State Business Summary.

## Income Statement

In order for an income statement to accurately measure farm income, it must include cash transactions and accrual adjustments (changes in accounts payable, accounts receivable, inventories, and prepaid expenses).

Cash paid is the actual cash outlay during the year and does not necessarily represent the cost of goods and services actually used in 2000.

Change in inventory: Increases in inventories of supplies and other purchased inputs are subtracted in computing accrual expenses because they represent purchased inputs not actually used during the year. Decreases in purchased inventories are added to expenses because they represent inputs purchased in a prior year and used this year.

## CASH AND ACCRUAL FARM EXPENSES

65 Intensive Grazing Dairy Farms, 2000

| Expense Item | Cash <br> Paid | - | Change in Inventory or Prepaid Expense | + | Change in Accounts Payable |  | $=$ | Accrual <br> Expenses |  |

| Rent \& lease | 6,515 |  | 0 | << |  | 65 |  |  | 6,579 |
| Other |  |  |  |  |  |  |  |  |  |
| Insurance | 4,372 |  | 0 | << |  | 8 |  |  | 4,380 |
| Utilities (farm share) | 7,240 |  | 0 | $\ll$ |  | 39 |  |  | 7,279 |
| Interest paid | 13,586 |  | 0 | $\ll$ |  | -83 |  |  | 13,503 |
| Miscellaneous | 3,588 |  | -87 |  |  | 15 |  |  | 3,689 |
| Total Operating | \$ 201,810 | \$ | - $-2,321$ |  | \$ | 1,273 |  | \$ | 205,404 |
| Expansion livestock | 4,164 |  | 0 | << |  | 0 |  |  | 4,164 |
| Machinery depreciation |  |  |  |  |  |  |  |  | 13,476 |
| Building depreciation |  |  |  |  |  |  |  |  | 8,427 |
| TOTAL ACCRUAL EXPENSES |  |  |  |  |  |  |  | \$ | 231,471 |

Change in prepaid expenses (noted above by $\ll$ ) is a net change in non-inventory expenses that have been paid in advance of their use. For example, prepaid lease expense on the beginning of year balance sheet represents last year's payment for use of the asset during this year. End of year prepaid expense represents payments made this year for next year's use of the asset. Adding payments made last year for this year's use of the asset, and subtracting payments made this year for next year's use of the asset is accomplished by subtracting the difference.
Change in accounts payable: An increase in accounts payable from beginning to end of year is added when calculating accrual expenses because these expenses were incurred (resources used) in 2000 but not paid for. A decrease is subtracted because it represents payment for resources used before 2000.

Accrual expenses are an estimate of the costs of inputs actually used in this year's production. They are the cash paid, less changes in inventory and prepaid expenses, plus accounts payable.

## CASH AND ACCRUAL FARM RECEIPTS

65 Intensive Grazing Dairy Farms, 2000

| Total Receipts | \$ | 253,353 |  | \$ | 6,319 |  | \$ | 666 |  | \$ | 260,337 |

[^1]Cash receipts include the gross value of milk checks received during the year plus all other payments received from the sale of farm products, services, and government programs. Nonfarm income is not included in calculating farm profitability.

Changes in inventory of assets produced by the business are calculated by subtracting beginning of year values from end of year values excluding appreciation. Increases in livestock inventory caused by herd growth and/or quality are added, and decreases caused by herd reduction and/or quality are subtracted. Changes in inventories of crops grown are also included. An increase in advanced government receipts is subtracted from cash income because it represents income received in 2000 for the 2001 crop year in excess of funds earned for 2000. Likewise, a decrease is added to cash government receipts because it represents funds earned for 2000 but received in 1999.

Changes in accounts receivable are calculated by subtracting beginning year balances from end year balances. Payments in January for milk produced in December 2000 compared to January 2000 payments for milk produced in 1999 are included as a change in accounts receivable.

Accrual receipts represent the value of all farm commodities produced and services actually generated by the farm business during the year.

## Profitability Analysis

Farm operators* contribute labor, management, and equity capital to their businesses and the combination of these resources, and the other resources used in the business, determines profitability. Farm profitability can be measured as the return to all family resources or as the return to one or more individual resources such as labor and management.

These measures should be considered estimates as they include inventory values that are only estimates and they include an unknown degree of error stemming from cash flow imbalances.

[^2]Net farm income is the return to the farm operators and other unpaid family members for their labor, management, and equity capital. It is the farm family's net annual return from working, managing, and financing the farm business. This is not a measure of cash available from the year's business operation. Cash flow is evaluated later in this report.

Net farm income is computed both with and without appreciation. Appreciation represents the change in values caused by annual changes in prices of livestock, machinery, real estate inventory, and stocks and certificates (other than Farm Credit). Appreciation is a major factor contributing to changes in farm net worth and must be included for a complete profitability analysis.

## NET FARM INCOME

Intensive Grazing Dairy Farms, 2000

| Item | 65 Grazing Dairy Farms* | 17 Above Average Farms* | 13 Below Average Farms* |
| :---: | :---: | :---: | :---: |
| Total accrual receipts | \$ 260,337 | \$ 221,532 | \$ 338,940 |
| Appreciation: Livestock | 4,003 | 3,299 | 5,377 |
| Machinery | 5,238 | 2,514 | 9,931 |
| Real Estate | 4,714 | 2,634 | 12,743 |
| Other Stock \& Certificates | 592 | -323 | 629 |
| Total Including Appreciation | \$ 274,884 | \$ 229,656 | \$ 367,620 |
| Total accrual expenses | - 231,471 | - 171,729 | - 333,164 |
| Net Farm Income (with appreciation) | \$ 43,413 | \$ 57,927 | \$ 34,456 |
| Net Farm Income Per Cow (with appreciation) | \$ 467 | \$ 805 | \$ 263 |
| Net Farm Income (without appreciation) | \$ 28,866 | \$ 49,803 | \$ 5,776 |
| Net Farm Income Per Cow (without appreciation) | \$ 310 | \$ 692 | \$ 44 |

* See page 1 for a description of these groups of farms.

The chart below shows the relationship between net farm income per cow (with appreciation) and pounds of milk sold per cow. Generally, farms with a higher production per cow have higher profitability per cow.

NET FARM INCOME PER COW AND MILK PER COW
65 Intensive Grazing Farms, 2000

Net farm income without appreciation averaged $\$ 28,866$ on these 65 farms in 2000. The range in net farm income without appreciation was from less than $\$-63,000$ to more than $\$ 266,000$. Net farm income was less than $\$ 20,000$ on 40 percent of the farms, between $\$ 20,000$ and $\$ 40,000$ on 25 percent of the farms, while 35 percent showed net farm income of $\$ 40,000$ or more.

DISTRIBUTION OF NET FARM INCOME WITHOUT APPRECIATION
65 Intensive Grazing Dairy Farms, 2000

The importance of cost control and its impact on farm profitability are illustrated in the chart below. As the operating cost of producing milk per hundreweight increased, net farm income per cow fell.

Net Farm Income/Cow \& Operating Cost of Producing Milk/Cwt. 65 Intensive Grazing Farms, 2000

Labor and management income is the return which farm operators receive for their labor and management used in the farm business. Appreciation is not included as part of the return to labor and management because it results from ownership of assets rather than management of the farm business. Labor and management income is calculated by deducting a charge for family labor unpaid and the opportunity cost of using equity capital, at a real interest rate of five percent, from net farm income excluding appreciation. The interest charge of five percent reflects the long-term average rate of return above inflation that a farmer might expect to earn in comparable risk investments.

## LABOR AND MANAGEMENT INCOME

Intensive Grazing Dairy Farms, 2000

| Item | 65 Grazing <br> Dairy Farms* |  | 17 Above Average Farms* |  | 13 Below Average Farms* |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Net farm income without appreciation | \$ | 28,866 | \$ | 49,803 | \$ | 5,776 |
| Family labor unpaid @ \$1,900 per month | - | 6,460 | - | 7,220 | - | 6,650 |
| Interest on average equity capital @ 5\% real rate | - | 20,120 | - | 14,278 | - | 27,502 |
| Labor \& Management Income per farm | \$ | 2,286 | \$ | 28,305 | \$ | -28,376 |
| Labor \& Management Income per Operator/Manager | \$ | 1,693 | \$ | 20,813 | \$ | -24,047 |
| Labor \& Management Income per Operator per Cow | \$ | 18 | \$ | 289 | \$ | 184 |

* See page 1 for a description of these groups of farms.

Labor and management income per operator averaged $\$ 1,693$ on these 65 farms in 2000. The range in labor and management income per operator was from less than $\$-132,000$ to more than $\$ 97,000$. Returns to labor and management were less than $\$ 0$ on 45 percent of the farms. Labor and management income per operator was between $\$ 0$ and $\$ 20,000$ on 35 percent of the farms while 20 percent showed labor and management incomes of $\$ 20,000$ or more per operator.

DISTRIBUTION OF LABOR \& MANAGEMENT INCOMES PER OPERATOR
65 Intensive Grazing Dairy Farms, 2000

The distribution of labor and management income per operator on grazing farms is very similar to the distribution for all farms across the state that participate in the DFBS project. The largest percentage of farms fall near $\$ 0$ to $\$ 20,000$ with a considerable percentage less than zero. One comparison to make to the state distribution is the percentage of farms that were above $\$ 20,000$ labor and management income per operator. For the intensive grazing farms, $20 \%$ of the farms had returns that were over \$20,000, while for the 294 farms across the state, $26 \%$ had returns greater than $\$ 20,000$ in 2000.

Return on equity capital measures the net return remaining for the farmer's equity or owned capital after a charge has been made for the owner-operator's labor and management. The earnings or amount of net farm income allocated to labor and management is the opportunity cost of operators' labor and management estimated by the cooperators. Return on equity capital is calculated with and without appreciation. The rate of return on equity capital is determined by dividing the amount returned by the average farm net worth or equity capital. Return on total capital is calculated by adding interest paid to the return on equity capital and then dividing by average farm assets to calculate the rate of return on total capital. Net farm income from operations ratio is net farm income (without appreciation) divided by total accrual receipts.

## RETURN ON EQUITY CAPITAL AND RETURN ON TOTAL CAPITAL

## Farm and Family Financial Status

The first step in evaluating the financial position of the farm is to construct a balance sheet which identifies and values all the assets and liabilities of the business. The second step is to evaluate the relationship between assets, liabilities, and net worth and changes that occurred during the year.

Financial lease obligations are included in the balance sheet. The present value of all future payments is listed as a liability since the farmer is committed to make the payments by signing the lease. The present value is also listed as an asset, representing the future value the item has to the business. For 2000, lease payments were discounted by 9.75 percent to obtain their present value.

Advanced government receipts are included as current liabilities. Government payments received in 2000 that are for participation in the 2001 program are the end year balance and payments received in 1999 for participation in the 2000 program are the beginning year balance.

Current Portion or principal due in the next year for intermediate and long term debt is included as a current liability.

2000 FARM BUSINESS $\&$ NONFARM BALANCE SHEET
65 Intensive Grazing Dairy Farms, 2000

Nonfarm Assets, Liabilities \& Net Worth (Average of 40 farms reporting)

| Assets |  | Jan. 1 |  | Dec. 31 | Liabilities \& Net Worth |  | Jan. 1 | Dec. 31 |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |

| Total Nonfarm Assets | \$ | 45,113 | \$ | 55,776 | NONFARM NET WORTH | \$ | 39,220 | \$ | 50,058 |

| Farm \& Nonfarm Assets, Liabilities, and Net Worth* | Jan. 1 | Dec. 31 |
| :--- | ---: | :---: |
|  |  |  |
| Total Assets | $\$ 631,202$ | $\$ 668,429$ |
| Total Liabilities | 197,839 | $\frac{207,699}{\$ 433,363}$ |
| TOTAL FARM \& NONFARM NET WORTH | 460,730 |  |

[^3]Balance sheet analysis involves examination of relative asset and debt levels for the business. Percent equity is calculated by dividing end of year net worth by end of year assets and multiplying by 100 . The debt to asset ratio is compiled by dividing liabilities by assets. Low debt to asset ratios reflect business solvency and the potential capacity to borrow. The leverage ratio is the dollars of debt per dollar of equity, computed by dividing total farm liabilities by farm net worth. Debt levels per productive unit represent old standards that are still useful if used with measures of cash flow and repayment ability. A current ratio of less than 1.5 or that has been falling warrants additional evaluation. The amount of working capital that is adequate must be related to the size of the farm business.

## BALANCE SHEET ANALYSIS

Intensive Grazing Dairy Farms, 2000

* See page 1 for a description of these groups of farms.

Farm inventory balance is an accounting of the value of assets used on the balance sheet and the changes that occur from the beginning to end of year. Changes in the livestock inventory are included in the dairy analysis. Net investment indicates whether the capital stock is being expanded (positive) or depleted (negative).

## FARM INVENTORY BALANCE

| Appreciation |  |  | $+$ | 4,714 |  |  | $+$ | 5,238 |
| Value end of year |  |  | \$ | 263,512 |  |  | \$ | 124,775 |

[^4]The Statement of Owner Equity has two purposes. It allows (1) verification that the accrual income statement and market value balance sheet are consistent (in accountants terms, they reconcile) and (2) identification of the causes of change in equity that occurred on the farm during the year. The Statement of Owner Equity allows you to determine to what degree the change in equity was caused by (1) earnings from the business, and nonfarm income, in excess of withdrawals being retained in the business (called retained earnings), (2) outside capital being invested in the business or farm capital being removed from the business (called contributed/withdrawn capital), (3) increases or decreases in the value (price) of assets owned by the business (called change in valuation equity), and (4) the error in the business cash flow accounting.

Retained earnings is an excellent indicator of farm generated financial progress.

## STATEMENT OF OWNER EQUITY (RECONCILIATION)

Intensive Grazing Dairy Farms, 2000

[^5]
## Cash Flow Statement

Completing an annual cash flow statement is an important step in understanding the sources and uses of funds for the business. Understanding last year's cash flow is the first step toward planning and managing cash flow for the current and future years.

The annual cash flow statement is structured to show net cash provided by operating activities, investing activities, financing activities and from reserves. All cash inflows and outflows, including beginning and end balances, are included. Therefore, the sum of net cash provided from all four activities should be zero. Any imbalance is the error from incorrect accounting of cash inflows/outflows. You should be aware that all profitability measures may be affected by this error.

ANNUAL CASH FLOW STATEMENT
65 Intensive Grazing Dairy Farms, 2000

## Repayment Analysis

A valuable use of cash flow analysis is to compare the debt payments planned for the last year with the amount actually paid. The measures listed below provide a number of different perspectives on the repayment performance of the business. However, the critical question to many farmers and lenders is whether planned payments can be made in 2001. The cash flow projection worksheet on the next page can be used to estimate repayment ability, which can then be compared to planned 2001 debt payments shown below.

FARM DEBT PAYMENTS PLANNED

| Percent of total 2000 farm receipts | 14\% | 17\% |  | 10\% | 11\% |  | 16\% | $23 \%$ |  |
| Percent of 2000 milk receipts | 17\% | 20\% |  | 13\% | 14\% |  | 21\% | 29\% |  |

The coverage ratios measure the ability of the farm business to meet its planned debt payment schedule. The ratios show the percentage of payments planned for 2000 (as of December 31, 1999) that could have been made with the amount available for debt service in 2000. Farmers who did not participate in DFBS in 1999 have their 2000 coverage ratios based on planned debt payments for 2001.

COVERAGE RATIOS
Same Intensive Grazing Dairy Farms, 1999 \& 2000

Same 16 Above Average Farms, 1999 \& 2000

## Cropping Analysis

The cropping program is an important part of the dairy farm business and often represents opportunities for improved productivity and profitability. A complete evaluation of what the available land resources are, how they are being used, how well crops are producing, and what it costs to produce them is important to evaluating alternative cropping and feed purchasing alternatives.

| Total Tillable Acres | 65 | 271 |  |  |  | 17 | 190 |  | 13 | 332 |  |

*This column represents the average acreage for the farms producing that crop. For the 65 New York dairy farms, average acreages including those farms not producing were hay crop 139 , corn silage 44 , corn grain 7 , oats 1 , wheat 1 , tillable pasture 62 , and idle 6.

Average crop acres and yields compiled for the region are for the farms reporting each crop. Yields of forage crops have been converted to tons of dry matter using dry matter coefficients reported by the farmers. Grain production has been converted to bushels of dry grain equivalent based on dry matter information provided.

The following crop/dairy ratios indicate the relationship between forage production, forage production resources, and the dairy herd.

## CROP/DAIRY RATIOS

| Total forage acres per cow | 2.03 | 2.64 | 2.53 |
| Harvested forage dry matter, tons per cow | 6.12 | 1.56 | 1.59 |
|  |  | 4.92 | 4.90 |

[^6]Cropping Analysis (continued)
A number of cooperators have allocated crop expenses among the hay crop, corn, and other crops produced. Fertilizer and lime, seeds and plants, and spray and other crop expenses have been computed per acre and per production unit for hay and corn. Additional expense items such as fuels, labor, and machinery repairs are not included. Intensive grazing was used by all farms reported in the below tables.

Most machinery costs are associated with crop production and should be analyzed with the crop enterprise. Total machinery expenses include the major fixed costs (interest and depreciation), as well as the accrual operating costs. Although machinery costs have not been allocated to individual crops, they are shown below per total tillable acre.

ACCRUAL MACHINERY EXPENSES

## Dairy Analysis

Analysis of the dairy enterprise can reveal strengths and weaknesses of the dairy farm business. Information on this page should be used in conjunction with DHI and other dairy production information. Changes in dairy herd size and market values that occur during the year are identified in the table below. The change in inventory value without appreciation is attributed to physical changes in herd size and quality. Any change in inventory is included as an accrual farm receipt when calculating all of the profitability measures on pages 16 and 17.

DAIRY HERD INVENTORY

* See page 1 for a description of these groups of farms.

Total milk sold and milk sold per cow are extremely valuable measures of size and productivity, respectively, on the dairy farm. These measures of milk output are based on pounds of milk marketed during the year.

MILK PRODUCTION
Intensive Grazing Dairy Farms, 2000

| Item | 65 Grazing | 17 Above Average | 13 Below Average <br> Dairy Farms |
| :--- | :---: | :---: | :---: |
| Total milk sold, lbs. | Dairy Farms | $1,585,980$ | $1,368,938$ |
| Milk sold per cow, lbs. | 17,107 | 19,075 | $1,945,511$ |
| Average milk plant test, percent butterfat | $3.73 \%$ | $3.72 \%$ | 14,808 |

Monitoring and evaluating culling practices and experiences on an annual basis are important herd management tools. Culling rate can have an effect on both milk per cow and profitability.

ANIMALS LEAVING THE HERD

|  | Number | Percent* | Number | Percent* | Number | Percent* |
| Cows sold for beef | 22 | 23.7 | 18 | 25.0 | 34 | 26.0 |
| Cows sold for dairy | 2 | 2.2 | 2 | 2.8 | 7 | 5.3 |
| Cows died | 3 | 3.2 | 3 | 4.2 | 4 | 3.1 |
| Culling rate** |  | 26.9 |  | 29.2 |  | 29.0 |

[^8]The cost of producing milk has been compiled using the whole farm method and is featured in the following table. Accrual receipts from milk sales can be compared with the accrual costs of producing milk per cow and per hundredweight of milk. Using the whole farm method, operating costs of producing milk are estimated by deducting nonmilk accrual receipts from total accrual operating expenses including expansion livestock purchased. Purchased inputs cost of producing milk are the operating costs plus depreciation. Total costs of producing milk include the operating costs of producing milk plus depreciation on machinery and buildings, the value of unpaid family labor, the value of operators' labor and management, and the interest charge for using equity capital.

## Capital and Labor Efficiency Analysis

Capital efficiency factors measure how intensively the capital is being used in the farm business. Measures of labor efficiency are key indicators of management's success in generating products per unit of labor input.

CAPITAL EFFICIENCY

| Operator's Labor |  | 1.18 Operator/Manager Equivalent |  |  |  |

## COMPARATIVE ANALYSIS OF THE FARM BUSINESS

## Progress of the Farm Business

Comparing your business with average data from regional DFBS cooperators that participated in both of the last two years can be helpful to establishing your goals for these parameters. It is equally important for you to determine the progress your business has made over the past two or three years, to compare this progress to your goals, and to set goals for the future.

## Grazing Farm Business Chart

The Farm Business Chart is a tool, which can be used in analyzing your business. Compare your business by drawing a line through or near the figure in each column which represents your current level of performance. The five figures in each column represent the average of each 20 percent or quintile of farms included in the regional summary. Use this information to identify business areas where more challenging goals are needed.

## FARM BUSINESS CHART FOR FARM MANAGEMENT COOPERATORS

65 Intensive Grazing Dairy Farms, 2000

[^11]
## SUPPLEMENTARY INFORMATION

Each year DFBS cooperators volunteer to complete supplementary data collection forms looking at selected management aspects of the business or specific research areas being studied. This is in addition to the normal DFBS data collection form. Two areas that were examined this year were the source of dairy replacements and the breakdown of the milk income and marketing expenses. Following is a summary of this information.

## SOURCE OF DAIRY REPLACEMENTS

91 New York Dairy Farms, 2000

| Animals Entering Herd | Average |
| :--- | :---: |
| Number calving in 2000 for first time | 118 |
| Animals purchased, $\%^{1}$ | 17.2 |
| Animals raised by farm, $\%^{2}$ | 82.8 |
| Current Heifer Inventory | 81 |
| Raised on dairy, \% | 19 |

${ }^{1}$ Animals purchased are animals purchased from a different farm and were not the farm's genetics.
${ }^{2}$ Animals raised by farm are animals that were born on the farm and entered the herd, which includes animals raised by the farm or custom grower.

On the average farm, 118 animals calved for the first time in 2000. The breakdown on these animals for source was $17.2 \%$ purchased and $82.8 \%$ raised by the farm. Of the current heifer inventory, $81 \%$ were raised on the dairy and $19 \%$ were being raised by a custom grower. There is increased interest in evaluating the dairy replacement enterprise.

## Milk Income and Marketing Expense Breakdown

Starting January $1^{\text {st }}, 2001$, the northeast switched to multiple components pricing, which changed the format of the milk check and how farmers received payment for their milk. To examine the breakdown of the gross milk income and the marketing expenses, 74 farms filled out a detailed form for all the different sources of income for milk sales and the milk marketing expenses on an accrual basis. This information is reported in the following two tables. The tables are divided into six different areas, each representing a different area of income or expenses.

The first section looks at the value of the milk components on a per cwt. basis. The second area looks at the Producer Price Differential. The third area looks at the premiums a farm receives. Any premiums not specifically noted as quality or volume related are included in market premiums. The fourth area looks at the expenses associated with marketing milk. A new line item in this section is the expenses associated with utilizing forward contracting or hedging programs to market milk, such as commission or broker fees. The fifth area is income from the compact program or from forward contracting or hedging programs. The sixth area is the patronage dividends or refunds from the milk cooperatives. Equity purchased in the milk cooperative utilizing a monthly deduction from the milk check or a percent of the patronage dividend is treated as a capital purchase and is not a milk marketing expense. The cumulative total for these six areas is the net price received on farms. Your net farm price can be found on page 10 of your farm's DFBS report.

The table on page 39 reports the averages for these different areas. The table on page 40 contains the range for each of the individual lines of the report. This table is in farm business chart format with each item sorted independently and ranked by fifths. Numbers for the different areas will not add to the totals for that quintile or to the net price received because the highest farms for each item were averaged, not the same farms throughout the six areas. This table shows the range of income and expenses received by farms for all the different areas.

For your individual farm, compare your accrual numbers following this same format to look at how you compare to other farms in your region and to identify possible areas to generate additional revenue.

| PPD - hauling + mkt premiums, \$ per Cwt. | 1.85 | 2.01 | 2.13 | 2.38 | 3.07 |

## IDENTIFY AND SET GOALS

If businesses are to be successful, they must have direction. Written goals help provide businesses with an identifiable direction over both the long and short term. Goal setting is as important on a dairy farm as it is in other businesses. Written goals are a tool which farm operators can use to ensure that the business continues to move in the desired direction. Goals should be SMART:

1. Goals should be Specific.
2. Goals should be Measurable.
3. Goals should be Achievable but challenging.
4. Goals should be Rewarding.
5. Goals should be Timed with a designated date by which the goal will be achieved.

Goal setting on a dairy farm should be a process for writing down and agreeing on goals that you have already given some thought to. It is also important to remember that once you write out your goals they are not cast in concrete. If a change takes place which has a major impact on the farm business, the goals should be reworked to accommodate that change. Refer to your goals as often as necessary to keep the farm business progressing.

It is important to identify both objectives (long-range) and goals (short-range) when looking at the future of your farm business.

A suggested format for writing out your goals is as follows:
a. Begin with a mission statement which describes why the business exists based on the preferences and values of the owners.
b. Identify 4-6 objectives.
c. Identify SMART goals.

## GLOSSARY AND LOCATION OF COMMON TERMS

Accounts Payable - Open accounts or bills owed to feed and supply firms, cattle dealers, veterinarians and other providers of farm services and supplies.

Accounts Receivable - Outstanding receipts from items sold or sales proceeds not yet received, such as the payment for December milk sales received in January.

Accrual Expenses - (defined on page 15)
Accrual Receipts - (defined on page 16)
Annual Cash Flow Statement - (defined on page 24)
Appreciation - (defined on page 17)
Asset Turnover Ratio - The ratio of total farm income to total farm assets, calculated by dividing total accrual operating receipts plus appreciation by average total farm assets.

Balance Sheet - A "snapshot" of the business financial position at a given point in time, usually December 31. The balance sheet equates the value of assets to liabilities plus net worth.
bST Usage - An estimate of the percentage of herd, on average, that was injected with bovine somatotropin during the year.

Capital Efficiency - The amount of capital invested per production unit. Relatively high investments per worker with low to moderate investments per cow imply efficient use of capital.

Cash From Nonfarm Capital Used in the Business - Transfers of money from nonfarm savings or investments to the farm business where it is used to pay operating expenses, make debt payments and/or capital purchases.

Cash Flow Coverage Ratio - (defined on page 25)
Cash Paid - (defined on page 14)
Cash Receipts - (defined on page 16)
Change in Accounts Payable - (defined on page 15)
Change in Accounts Receivable - (defined on page 16)
Change in Inventory - (defined on page 16)
Cost of Term Debt - A weighted average of the cost of borrowed capital to the farm. Calculate by multiplying end of year principal of each loan that is borrowed by the interest rate for each loan at that time. Add up each amount that is calculated for each loan and then divide by total amount of borrowed funds. Do not include accounts payable, operating debt or advanced government receipts. This information is found on pages $8 \& 9$ of the data entry form.

Culling Rate - (defined on page 29)
Current Portion - (defined on page 20)
Current Ratio - Measures the extent to which current farm assets, if liquidated, would cover current farm liabilities. Calculated as current farm assets at end year divided by current farm liabilities at end year.

Dairy (farm) - A farm business where dairy farming is the primary enterprise, operating and managing this farm is a full-time occupation for one or more people and cropland is owned.

Dairy Cash-Crop (farm) - Operating and managing this farm is the full-time occupation of one or more people, cropland is owned but crop sales exceed 10 percent of accrual milk receipts.

Debt Coverage Ratio - (defined on page 25)
Debt Per Cow - Total end-of-year debt divided by end-of-year number of cows.
Debt to Asset Ratios - (defined on page 22)
Depreciation Expense Ratio - Machinery and building depreciation divided by total accrual receipts.
Dry Matter - The amount or proportion of dry material that remains after all water is removed. Commonly used to measure dry matter percent and tons of dry matter in feed.

Equity Capital - The farm operator/manager's owned capital or farm net worth.
Expansion Livestock - Purchased dairy cattle and other livestock that cause an increase in herd size from the beginning to the end of the year.

Farm Debt Payments as Percent of Milk Sales - Amount of milk income committed to debt repayment, calculated by dividing planned debt payments by total milk receipts. A reliable measure of repayment ability, see page 25 .

Farm Debt Payments Per Cow - Planned or scheduled debt payments per cow represent the repayment plan scheduled at the beginning of the year divided by the average number of cows for the year.

Financial Lease - A long-term non-cancelable contract giving the lessee use of an asset in exchange for a series of lease payments. The term of a financial lease usually covers a major portion of the economic life of the asset. The lease is a substitute for purchase. The lessor retains ownership of the asset.

Hired Labor Expense per Hired Worker Equivalent - The total cost to the farm per hired worker equivalent. Divide accrual hired labor expense by number of hired plus family paid worker equivalents.

Hired Labor Expense as \% of Milk Sales - The percentage of the gross milk receipts that is used for labor expense. Divide accrual hired labor expense by accrual milk sales.

Income Statement - A complete and accurate account of farm business receipts and expenses used to measure profitability over a period of time such as one year or one month.

Interest Expense Ratio - Accrual interest expense divided by total accrual receipts.
Labor and Management Income - (defined on page 18)
Labor and Management Income Per Operator - The return to the owner/manager's labor and management per fulltime operator.

Labor Efficiency - Production capacity and output per worker.

Leverage Ratio - (defined on page 22)
Liquidity - Ability of business to generate cash to make debt payments or to convert assets to cash.
Net Farm Income - (defined on page 17)
Net Farm Income from Operations Ratio - (defined on page 20)
Net Milk Receipts - Accrual milk receipts less milk marking expense.
Net Worth - The value of assets less liabilities equal net worth. It is the equity the owner has in owned assets.
Operating Costs of Producing Milk - (defined on page 30)

Operating Expense Ratio - Total accrual expenses less interest and machinery and building depreciation, divided by total accrual receipts.

Operator Resources/cwt. - The total value of labor contributed to the farm from all owner/operators. This measure is calculated by multiplying the number of months of labor provided by all owner/operators by $\$ 1,800$ and dividing by the number of cwt. produced during the year.

Opportunity Costs - The cost or charge made for using a resource based on its value in its most likely alternative use. The opportunity cost of a farmer's labor and management is the value he/she would receive if employed in his/her most qualified alternative position.

Other Livestock Expenses - All other dairy herd and livestock expenses not included in more specific categories. Other livestock expenses include DHIC, registration fees and transfers.

Part-Time Dairy (farm) - Dairy farming is the primary enterprise, cropland is owned but operating and managing this farm is not a full-time occupation for one or more people.

Personal Withdrawals and Family Expenditures Including Nonfarm Debt Payments - All the money removed from the farm business for personal or nonfarm use including family living expenses, health and life insurance, income taxes, nonfarm debt payments, and investments.

Profitability - The return or net income the owner/manager receives for using one or more of his or her resources in the farm business. True "economic profit" is what remains after deducting all the costs including the opportunity costs of the owner/manager's labor, management, and equity capital.

Purchased Inputs Cost of Producing Milk - (defined on page 30)
Renter - Farm business owner/operator owns no tillable land and commonly rents all other farm real estate.
Repayment Analysis - An evaluation of the business' ability to make planned debt payments.
Replacement Livestock - Dairy cattle and other livestock purchased to replace those that were culled or sold from the herd during the year.

Return on Equity Capital - (defined on page 20)
Return on Total Capital - (defined on page 20)

Solvency - The extent or ability of assets to cover or pay liabilities. Debt/asset and leverage ratios are common measures of solvency.

Total Costs of Producing Milk - (defined on page 30)
Total Labor Cost/cwt. - The total cost of all labor used on the farm on a per cwt. basis. The value of unpaid labor at $\$ 1,900$ per month plus the value of operator(s) labor at $\$ 1,900$ per month plus total hired labor expense divided by the number of cwt. produced.

Whole Farm Method - A procedure used to calculate costs of producing milk on dairy farms without using enterprise cost accounts. All non-milk receipts are assigned a cost equal to their sale value and deducted from total farm expenses to determine the costs of producing milk.

Working Capital - A theoretical measure of the amount of funds available to purchase inputs and inventory items after the sale of current farm assets and payment of all current farm liabilities. Calculated as current farm assets at end year less current farm liabilities at end year.
