# Corn Residue Harvest and Inefficient Groundwater Extraction

PURDUE UNIVERSITY.

Juan Sesmero and Aaron Cook

#### Motivation

- Corn residue promising feedstock to meet RFS cellulosic requirement.
- Irrigated corn belt candidate area: high yields/continuous corn
- Removal of stover decreases soil moisture (e.g. Doran et al., 1984; Power et al., 1998) which reduces yield unless more irrigation is applied.
- Concern about pressure on groundwater.

## Theory

- Inefficient over-extraction occur in common access resources.
- Welfare losses due to over-extraction can be empirically negligible depending on aquifer properties (Gisser-Sanchez)
- Welfare losses of over-extraction (if any) should be included in "social costs" of stoverbased energy.

## Research question

 What are the likely welfare losses associated with groundwater over-extraction caused by corn residue harvesting?

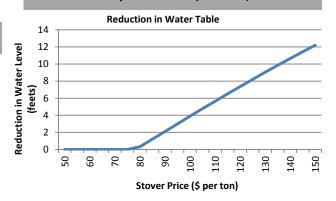

#### Model

 Farmer maximizes present value of future stream of profits subject to soil water dynamics and groundwater stock dynamics.

$$\begin{aligned} & \underset{(h_i, w_i)}{\text{Max}} \int_0^\infty e^{-rt} \Big( g_i p_y + \Big[ g_i h_i \Big( p_h - c_h^b \Big) - c_h^a \Big] - \Big( c_0 + c_1 H \Big) w_i \Big) \\ & \overset{\bullet}{I_t} = I_o + dg_t \Big( 1 - h_t \Big) - I_t \end{aligned} \qquad \qquad \begin{array}{c} h_i : \textit{stove harvest rate} \\ g_i : \textit{yield} \\ p_i : \textit{net revenue/ bu corn} \\ p_b - c_b^* : \textit{net revenue/ ton stove} \\ H : \textit{water level} \\ w_i : \textit{trrigation rate} \end{aligned}$$

- Feedback Nash Equilibrium (FE) in linear strategies compared to efficient solution.
- Model calibrated with observed data and results of agronomic experiments.

## Preliminary Results (mean)

## Preliminary Results (mean)

### **Conclusions**

- Results suggest welfare losses of overextraction may not be negligible in western Nebraska, Kansas, and Texas
- Under western NE conditions the FE supplies 112MGY at \$100 per dry ton.
   Efficient solution only for 2.56MGY. The efficiency loss associated with market supply is 600 million dollars
