The Demand for Nutrients in China: A Direct Approach

Xu Tian, and Xiaohua Yu

Department of Agricultural Economics and Rural Development
 Courant Research Centre "Poverty, Equity and Growth"
 University of Göttingen

1 Background

- Dramatical change in the structure of food consumption in China along with its rapid economic growth.
- The demand for nutrients also changes significantly.
- Whether malnutrition can be eliminated by economic growth is still controversial.
- Current literature mainly focus on macronutrients.
- Estimation in indirect approach is biased.

2 Objective

- Using a direct approach to estimate income elasticity of nutrients.
- Comparing the nutrient elasticity of different income group.

3 Method

- There are two commonly used econometric approaches to estimate income elasticity of nutrient.
 - Indirect approach: convert food elasticity to nutrient elasticity.
 - Direct approach: covert food consumption to nutrient intake and then regress nutrient intake directly on income.

$$N_k = \sum_i C_{ki} * F_i \quad E_i = F_i * P_i$$

$$\varepsilon_{N_k M} = \sum_i S_{ki} * \varepsilon_{F_i M} + \sum_i S_{ki} * \varepsilon_{C_{ki} M} \quad S_{ki} = \frac{N_{ki}}{N_k} = \frac{C_{ki} * F_i}{\sum_i C_{ki} * F_i}$$

$$\varepsilon_{N_k M} = \sum_i S_{ki} * \varepsilon_{E_i M} + \sum_i S_{ki} * \varepsilon_{C_{ki} M} - \sum_i S_{ki} * \varepsilon_{P_i M}$$

$$\varepsilon_{N_k M} = \sum_i S_{ki} * \varepsilon_{E_i M} - \sum_i S_{ki} * \varepsilon_{q_{ki} M} \quad q_{ki} = \frac{P_i * \theta_{ki}}{C_{ki}} \quad \frac{d \ln \theta_{ki}}{d \ln C_{ki}} = 0$$

Manganese	0.0879	0.2130*	0.0304

5 Conclusions

- Income elasticities of most nutrients are quite small.
- Poor people have higher nutrient elasticity than rich ones.
- Most nutrient elasticities are not significant for rich people.

6 Implication

- Income will not result in substantial improvements in nutrient intakes.
- More direct government intervention aiming at improve the nutritive status should be developed.
