1982 ANNUAL REPORT OF THE SOUTHEASTERN MINNESOTA
FARM MANAGEMENT ASSOCIATION

by

DELANE E. WELSCH, JOANNE M. GEIGEL, AND LORIN WESTMAN*

INTRODUCTION

The Department of Agricultural and Applied Economics and the Agricultural Extension Service of the University of Minnesota, and the Agricultural Extension Agents of several southeastern Minnesota counties are cooperating with the Southeastern Minnesota Farm Management Association in maintaining a farm management service. The Association was organized in the fall of 1927 by farmers in that part of the state for the purpose of studying the farm business through farm records. Each farmer pays an annual fee which covers a large part of the cost, with the balance defrayed by the Agricultural Extension and research programs of the University of Minnesota. The analysis of the records and the preparation of the report are handled by the Department of Agricultural and Applied Economics under the direction of Delane E. Welsch and Joanne Geigel. Lorin Westman is the Fieldman for this project. Arnold Sandager is the District Program Leader in Agriculture with the Agricultural Extension Service and works with the counties which are served by the Association.

Of the 66 farms in the Southeastern Association, 58 submitted records at the time of this report. The data for 54 farms are shown in the tables on succeeding pages. The rest were omitted from the information in the tables because the records were not sufficiently complete for a full analysis. No claim is made as to whether the farmers who belong to the Association are or are not representative of southeastern Minnesota. However, this report should be of value to farmers and others interested in agriculture in that it illustrates how farm records may be used as a basis for making an analysis of a farm business. It also shows typical enterprise costs and returns for 1982 and the difference in enterprise earnings as well as in total farm earnings between groups of farms.

The content of this report is somewhat different from those prior to 1977. While the roots of the analysis lie in the work of the Department of Agricultural and Applied Economics and its predecessor units over the past 60 years, the more detailed analysis found in this report was developed by Professor Edgar Persons of the University of Minnesota. This analysis is also used by Vocational Agriculture Adult Farm Business Management Education classes throughout Minnesota and in some other states. The computer work was done by Specialized Data Systems, Inc., Madison, Wisconsin. While we have altered the order in which the tables appear, the table numbers are the same as received from SDS.

*Welsch is Professor of Farm Management; Geigel is Farm Records Assistant; Westman is jointly Area Farm Management Extension Agent and Fieldman for the Association. The authors wish to thank the following people for their contributions to this report: Charles Kiefer and Terri Westman for their assistance in account book closing and coding; Mark Berle, Scott Schweer, Pat Schneider, Charlie Worm and Warren Winkleman for their careful review of each analysis, correction of errors, constructing the tables and excellent help and good humor in general throughout the process of producing the analyses and the report; Lai Chun Kan for special computer programming; Vernon Eidman, Kenneth Thomas and Burt Sundquist for review, all of the SDS staff for their helpfulness; and most importantly to Carol Hansen and Cindy Smith for all of their secretarial and clerical work throughout the project, and especially for putting this report together.

*Term Expires July, 1983.

**Term Expires July, 1984.

^{a/} Includes 3 farmers who were members of the Southeastern Association who were transferred to the South Central Association in the 1981-82 reorganization, and 4 farmers who were longer-term members of the South Central Association. The South Central Association merged with the Southeastern Association in late 1982, and the records of these 7 were processed with the Southeastern Association, although technically they were not members of the Southeastern Association in 1982.

35 TOTAL FARM RECEIPTS TO AVERAGE FARM CAPITAL (O.S.)		.470

TABLE 5 reports the assets, liabilities and resultant net worth position of the farm operator at the beginning and end of the year. (This asset list differs from TABLE 1 in that it includes the operator's non-farm assets and excludes the landlord's share of farm assets.) It also shows the change in net worth, or the growth in operator's equity (owned capital) during the year. Note that this TABLE 5 does not include addition to net worth resulting from appreciation in land values during the year, i.e., the same conservative market price per acre was assigned to both the beginning and the ending inventories of land. All depreciable assets, such as machinery, equipment, buildings, etc., are priced at cost basis minus depreciation, which does not take into consideration price appreciation due to inflation. (continued on next page)

So, for credit purposes, the operator may wish to revalue those classes of assets. While TABLE 1 shows farm assets for all 54 farms included in the Association averages, TABLE 5 includes data from only those 42 sole proprietorships which had complete net worth data. Net worth data for partnerships were excluded when one analysis was done for the partnership and the partners did not supply information on their individually owned farm assets and liabilities.

27 BEEF & BUFFALO (POUNDS)	217	311
28 PORK (POUNDS)	68	---
33 TOTAL FAMILY LIVING FROM THE FARM	\$ 552	\$ 696

TABLE 4 reports the cash and non-cash expenses of the farm operator's household. Averages include only those members who kept household and personal accounts complete enough to include at least line 5 (FOOD & MEALS BOUGHT). As a result, only 23 out of 54 farms were included in the averages. Accurate household and personal accounts are important if a family is to manage its financial affairs wisely and be able to check the accuracy of their financial accounts at the end of the year. If the family is unable or unwilling to keep accurate household accounts, then a household checking account separate from the farm checking account might be used. Values of items listed in lines 26-28 were assigned by the farm operator.

*Data for the most profitable farms is not reported as an insufficient number of them reported this information.

DESCRIPTION OF MEASURES OF FARM ORGANIZATION AND MANAGEMENT EFFICIENCY

The following explanations and definitions are for use in interpreting Table 8 and the Thermometer Chart.

1. Labor Earnings - A measure of the relative financial return for the operator's labor taking into account all income and expense, cash and non-cash, including a charge for the use of farm capital. This is based on the whole farm business and is found in Table 2B and Table 3.

2. Crop Yield Index - A measure of the crop yield level for all crops produced expressed as a percentage of the Association average.

3. Percent of Tillable Land in High Return Crops - A measure of crop selection based on a rating of individual crops. Crop ratings take into account such things as dollar return, effect on soil, TDN yield, labor required, etc. Ratings can be found on Table 9.

4. Gross Return Per Acre - An additional measure of crop selection based on total production times an average price for the crops.

5. Return per \$100 Feed Fed to Productive Livestock - Measures the general level of efficiency for all livestock. It is expressed as a percentage of the Association average and combines the individual indexes for all livestock enterprises on the farm into one figure.

6. Livestock Units Per 100 Acres - A measure of livestock density or population. Unit values are assigned to the various classes of livestock.

7. Size of Business - Work Units - A measure of the size of farm business, or total work load. A work unit represents the average accomplishment of a worker in one 10 hour day. Work Unit values are assigned to each class of livestock, each crop, and to other tasks utilizing farm labor. Total work units may also be interpreted differently for different farm situations such as work efficiency, degree of mechanization, careful planning, or hours worked. While it does not measure how hard a farmer works, it does measure how much is being accomplished on the farm.

8. Work Units Per Worker - Measures labor efficiency. Total work units divided by the number of workers including the operator, hired labor, and family labor.

9. Power, Machinery, Equipment and Building Expense Per Work Unit - A measure of expense control. It is the total cost of items listed in Table 3 divided by the number of work units.

10. Farm Capital Investment Per Worker - Indicates size of business. Useful in comparing a farm business to other industries or businesses.

Other items listed on Table 8 are related to the above measures and serve to further define and describe the efficiency level of a farm business. Note should be taken that items listed in Table 8 and the Thermometer Chart are to be considered in light of the individual farm and farm operator. Although in general, an above-average level for each factor listed would indicate above average earnings, this may not be true when individual farms are considered. The inter-relationship of factors varies from farm to farm.

TABLE 8. MEASURES OF FARM ORGANIZATION AND EFFICIENCY - 1982 - S.E.

ITEMS	Average of 54 Farms	11 Most Profitable Farms	11 Least Profitable Farms
1A RETURN TO OPERATOR'S LABOR & MANAGEMENT (2B/46)	2,900	52,616	(-45,125)

43 BUILDING, FENCE & TILING COST ALLOCATED TO CROPS	\$ 3,618.62	\$ 3,439.11	\$ 4,707.40

* ACRES INCLUDE ALL TILLABLE LAND, NON-TILLABLE HAY & PASTURE.

**ACRES INCLUDE ALL TILLABLE LAND, PLUS ACRES IN NON-TILLABLE HAY.

THERMOMETER CHART

Using your figures from TABLE 8, locate your standing with respect to the various measures of farm organization and management efficiency. The averages for the farms included in this summary are located between the dotted lines across the center of the chart.

AVERAGE PRICE RECEIVED FOR CROPS SOLD

This year, for the second time in the present system of analysis, the computerized crop enterprise analyses included information on the total quantity sold and average price received for all crops that were sold. Each individual member's crop enterprise print-outs include such information on lines 32 and 33. The Association average, high, and low tables contained in this report include the averages for the same items.

It has been recognized for some time that the measures of farm organization and efficiency shown in Table 8 no longer adequately explain variations in labor and management earnings on specialized crop farms or farms on which the major source of income is from crops alone. Therefore, this attempt to improve the farm business analysis should enhance our research in farm accounting which is aimed at how farmers manage the marketing of their crops. Information on this page deals with average price received for all corn, soybeans, and oats sold during the calendar year 1982. The average price received by all farmers is shown between the dotted lines in the center of the thermometer charts. The bar graphs show the percent of all farmers selling a particular crop whose price fell within the price intervals shown for each graph.

DESCRIPTION OF CROPS TABLES

The following tables for each individual crop represent an attempt to calculate the costs and returns for these enterprises. Returns include the value of the crop produced--line 4--(which was calculated as measured yield multiplied by a common harvest-time price--see footnote for exceptions) plus other crop income. The latter has two components: a cash component, such as diverted acre payments, deficiency payments, crop insurance payments for a loss, sale of a by-product (such as straw) etc.; and a non-cash component, which is the operator's estimate of the value of straw, corn stalks, and other crop by-products and residues used in livestock enterprises.

Two categories of costs are calculated. The first consists of costs that are "directly" attributable to that crop, such as fertilizer, chemicals, seed, etc., and are normally recorded on pages 38-39 of the Account Book. These are normally all cash costs, although some may have been actually paid in a previous year, i.e., fertilizer paid for last year but used on this year's crop. Thus the sum of fertilizer costs for all crops may not necessarily equal total fertilizer purchased in the current year as reported in TABLES 2B and 6B. The costs in this "direct" category may also be called variable costs, in two ways. The first is in that the level of these costs per acre can be varied by the farmer, such as varying the amount of fertilizer per acre, etc. The second is in that the total of these costs usually vary in direct proportion to the number of acres grown. For example, if 10% fewer acres of corn were planted, expenses for corn seed and fertilizer might decrease by 10%. The second category of costs represents an attempt to "allocate" some costs that are not easily attributable to a specific enterprise. Some are cash costs and others are non-cash, some are variable and others are fixed or overhead costs. For example, the ownership cost of farm power and machinery consists of depreciation, which is a non-cash, fixed cost that continues even if corn acreage is cut back by 10%. In contrast, the operation cost of farm power and machinery, which includes fuel, lubricants, and repair, is a cash variable cost.

The power and machinery costs (both ownership and operation) were allocated among crop (and livestock when present) enterprises on the basis of work units. The ownership costs and the total operation costs are each divided by the sum of total crop work units plus one-tenth of the total livestock work units (or one-twelfth if livestock work units are greater than 400) because livestock uses relatively less power per work unit than crops. The resulting ownership cost per work unit is then multiplied by the standard work unit per acre figure to obtain the allocated cost per acre. The same procedure is followed for operation costs. If the operator feels that this procedure does not adequately reflect his relative use of power among enterprises, or if he wants some enterprises to carry a relatively heavier cost burden than others, then he may modify this allocation by the use of different values for the Power Cost Allocation Factor (PCAF).

Land cost shown is an attempt to measure the opportunity cost of the land. For the tenant, the cash rent or equivalent was reported. For the owner-operator, the amount that could be received for renting out the land was obtained. Interest on machinery and equipment investment was calculated at 6% on the average amount held during the year (beginning plus ending inventories divided by two).

DESCRIPTION OF LIVESTOCK TABLES

Livestock provide an important source of farm income, especially on farms with relatively small acreages, or acreages not well suited to the production of cash crops. If the crop land area is limited, and/or the farm family is short of capital relative to labor, livestock may be needed to provide the volume of earnings necessary for family living and to meet goals that the farm family hopes to achieve.

The following tables provide cost and return calculations for the livestock enterprises on the farms included in this report. Since feed is the largest single item of cost for all classes of livestock, return above feed cost was used to classify farms into high or low in the following tables. The reader is cautioned to remember that farms are classified into the high or low return above feed cost categories for each table, so that a particular farm might be in the low category in one livestock table and in the high in another livestock table. And these classifications are separate and independent of the classifications based on labor earnings used in TABLES 1 through 6B. Feed costs are determined from feed records kept by the farm operator. Given the overwhelming importance of feed as the major cost of livestock production, it is suggested that the livestock producer try to keep an accurate set of feed records for each major livestock enterprise.

Purchase price is used for all feeds purchased from off the farm. An average price, shown elsewhere in this report, is charged for each kind of home-grown feed.

In general, the net increase in value of animals is calculated as: ending inventory plus sales plus transfers out plus butchered minus beginning inventory minus purchases minus transfers in. For fed livestock, pounds or cwt produced is calculated in the same way. Since inventory values play such an important role in determining net increase in value, producers are urged to be extremely careful in changing inventory prices, especially of breeding livestock which may be on hand during the whole year. That is, paper gains and losses from changing prices of inventory should be avoided.

Return over feed costs, because of the proportion of total costs represented by feed, is an important overall measure, and very useful in comparing an enterprise over time on the same farm or with other farms in a given year. It is a general measure that indicates success in getting top dollar for products sold, as well as in holding down feed costs. The relative size of the return over feed cost, or a companion measure, return for \$100 feed fed, varies by kind of enterprise, depending upon the size of non-feed costs. For example, dairy cows, with high labor and building and equipment costs, need a higher return above feed cost and return per \$100 feed fed than a low labor, low building/equipment cost enterprise such as feeder cattle. It also varies by year as both commodity prices and feed prices vary.

A few of the other direct cash costs, such as veterinary costs, bedding, etc. are shown in each livestock table. Certain overhead costs were also allocated among enterprises, using the work unit procedure described for the crops tables, which again can be modified by use of power and machinery, livestock equipment, and building and fencing cost allocation factors (PCAF, ECAF, AND BCAF, respectively).

29 TOTAL FARM CAPITAL	\$640,043	\$644,013
30 INCREASE OR DECREASE IN TOTAL FARM CAPITAL		\$ 3,971

TABLE 1 shows the beginning and end of the year inventories of farm capital. These inventories include both the value of the operator's assets, as well as the land-lord's in the case of rented assets. (TABLE 5 shows only the operator's share of farm capital.) Prices of Productive Livestock, and Crop, Seed and Feed reflect the physical amounts on hand at the beginning and end of the year, multiplied by a conservative market price on January 1, and December 31 (as shown in TABLE 7.) Power, Machinery and Equipment are priced at cost basis less depreciation on January 1, and December 31. Cont'd next page.

30 INCREASE OR DECREASE IN TOTAL FARM CAPITAL		\$ 27,554		\$ 6,426

Land is valued at cost basis. No change in the price of land was allowed, so the same value is used for January 1, and for December 31. Measures of farm size, other than total farm capital, are shown in lines 1 through 7. The concept of Work Units is discussed on page 9. The number of workers shown in line 7 includes the operator(s), hired workers, unpaid family members, and the labor portion of custom work hired.

SEE PAGE 36 FOR EXPLANATORY NOTE FOR THIS TABLE.

EXPLANATORY NOTES FOR TABLES 2A, 2B, 3, 6A, AND 6B

TABLES 2A and 2B comprise the earnings statement for the whole farm (including both operator's and landlord's shares). Lines 1 through 34 and line 36 of TABLE 2A show all sources of cash income to the farm. Line 38 reflects any increase in farm capital, while line 39 credits the business for any produce used by the family. Line 35 records the amount of patronage refunds credited to the business, part of which may have been the amount of patronage refunds credited to the business, part of which may have been received as cash and part as equity shares. TABLE 2B shows in lines 1 through 39, all cash expenses of the farm except principal and interest payments on farm debt. Note that cash rent is also not included, as it is an internal farm transaction between operator and landlord. Line 40 reflects any decrease in inventory while line 41 shows an interest return or charge of 7% for all farm capital. Line 46, Labor Earnings, represents the return for the operator's labor and management after all expenses (cash, accrual and imputed) are deducted. In the case of partnerships, line 43 assigns a fixed return to one partner, with the residual return going to the other (line 46). In line 49, the fixed return to one partner is added back to the residual (line 46) and that number is divided equally among the partners.

TABLE 3 represents another way of categorizing and reporting the receipts, expenses and labor earnings of the total farm business. In lines 2 through 21, cash receipts are adjusted for changes in inventory for each production enterprise, thus giving a better picture of the "value produced" contribution of each enterprise. In lines 24 through 30, each category of cash expense is adjusted for change in inventory. Line 33, fixed return to one partner, and line 36, interest charge on farm capital, are handled in the same manner as comparable items were in TABLE 2B (lines 43 and 41, respectively). Although calculated in a different way, the resulting labor earnings (line 38) is equal to that in TABLE 2B (line 42). Lines 24, 25, 28, and 29 actually report the sum of four cost items for each of these categories of capital assets. They are: depreciation; gasoline, oil, and grease bought; repair and operation cost, and share of custom work hired that was attributed to this category of asset (e.g., 80% of milk hauling cost might be attributed to truck and auto expense). While depreciation cannot be calculated directly from these tables, it can be approximated by the calculation: beginning inventory (TABLE 1) plus assets bought (TABLE 2B) minus ending inventory (TABLE 1). The number missing for a complete depreciation calculation is capital asset sales, which is not given for each category of assets in these tables (but is given for all assets in TABLE 2A).

TABLES 6A and 6B constitute the earnings statement for the operator. TABLES 6A and 6B, therefore, are similar to TABLES 2A and 2B, except that 6A and 6B exclude the landlord's share of income and expenses. Thus, for the full owner-operator, TABLES 1A and 6A should be identical through line 40. TABLES 2B and 6B differ in that 6B includes cash rent paid (line 30) and interest paid on borrowed money (line 34) while 2B does not include cash rent or interest paid. Line 43 of TABLE 6B thus contains an interest charge on only the operator's equity farm capital, whereas in line 41, TABLE 2B, interest was charged on all farm capital. Line 48 of TABLE 6B thus represents return to operator and family unpaid labor and management and equity capital. When money spent on family living is subtracted from line 48, the remainder plus non-farm income should be equal to the increase in net worth, shown in line 16 of TABLE 5.

TABLE 7. SUPPLEMENTARY INFORMATION USED IN ENTERPRISE ANALYSIS - 1982 - S.E.

OATS	\$3/BU.

a/ A work unit represents the average accomplishment of an average worker in one ten hour day. It is used to measure size of business and to allocate overhead costs to crop and livestock enterprises.

b/ An animal unit is based on the amount of T.D.N. required to support each kind of livestock with the dairy cow as the basis for comparison. It is used to measure intensity of livestock production and to measure size of business.

16 WEIGHTED CONSUMER PRICE INDEX ^{d/}	60.1	80.4	97.2	147.0	195.4	217.4	246.8	272.4	289.1

^{a/} Data not available for 1940-42; seven year average is used.

^{b/} Data not available for 1940-43; six year average is used.

^{c/} Data not available for 1954-55; eight year average is used.

^{d/} Used Consumer Price Index for "all items" (1967=100). Ten-year averages were obtained by dividing the number of farms each year by the index for that year, then adding the results and dividing the sum by the total number of farms in the ten-year analysis. The price deflator used was, therefore, a "modified" or "weighted" Consumer Price Index. For individual years, (1977-80) the CPI on line 16 is that which was reported by the Department of Commerce.

^{e/} Average of those reporting, as not all farmers report this item.

^{a/}The reader is cautioned that these six items are calculated as follows: The total number of head, pounds, litters, hens, etc., reported by all farmers whose records are included in the summary averages, is divided by the number of records included in the analysis (first line, table 23). Thus, these items are not averages per farm reporting this item; instead, they are averages for all farms included in the summary, regardless of whether all farms had that particular livestock enterprise or not. The correct interpretation of such information is to display trends over time in agriculture in the areas in which record keepers live whose records are included in the summary. For example, the number of hens is decreasing, the number of litters being farrowed is increasing, etc., in the general area covered by the Southeastern Minnesota Farm Management Association. Method of calculation changed slightly in 1977.

^{b/}Data was not available for 1954-55. Figures are based on an eight-year average.

^{c/}Seven-year average.

^{d/}Nine-year average.
