Findings

What agricultural and resource economists are finding about food, farm, and resource issues.*

- The Boll Weevil Eradication Program in Alabama, Florida, and Georgia increased cotton yields 100 pounds per acre and substantially increased producer profits—say Ahouissoussi, Wetzstein and Duffy.
- The 1990 Farm Bill, even with the new triple base provisions limiting payment acres, may increase whole farm profits of cotton farms because it eliminates the limited cross-compliance provisions and changes base acreage computations from a five-year to a three-year period—say Duffy, Cain and Young.
- Rural road maintenance costs in New England could be substantially reduced if town governments cooperate on road management, maintenance and engineering activities—say Deller, Halstead and Hall.
- Typical midwestern feedlots realize significantly higher profits if feeder calf producers vaccinate for bovine respiratory disease complex *prior* to shipment of calves to the feedlot—say Nyamusika, Spreen, Rae and Moss.
- As household income and education rise, the demand for reduced-fat milk increases relative to the demand for whole-fat milk—say Cornick, Cox, and Gould.
- Two-season calving and alternative culling decisions, in contrast to traditional spring-only calving and culling all open cows, can increase profits of cow-calf operations—say Tronstad and Gum.
- Use of Porcine Somatotropin (PST) on representative farms in Missouri and Indiana will increase farm profits—say Richardson, Anderson, Peel and Phillips.
- In potential trade-environment agreements between the U.S. and Latin American countries, the benefits of preferential access for fruit juices to the U.S. market outweigh substantially the costs to Latin American exporters of farm worker pesticide safety regulations similar to those of the U.S.—say Ballenger, Beattie and Krissoff.

*Findings are taken from recently or soon-to-be published research in the *American Journal of Agricultural Economics*, *Journal of Agricultural and Resource Economics*, *Review of Agricultural Economics*, *Journal of Agricultural Economics Research*, *Journal of Agricultural and Applied Economics*, *Agricultural and Resource Economics Review*, *Land Economics*, *Journal of Environmental Economics and Management*, *Agribusiness—an International Journal*, and other journals which publish the research findings of agricultural and resource economists. Abbreviated citations are found on page 45.

ON OUR COVER—Water ties agriculture to urban areas, as depicted by the graphics firm, Dungeonworks. Feature authors discuss new and proposed rules for agriculture—rules to distribute water between agricultural and other uses, and rules to lessen agriculture's impact on water quality.

Guest editorial: After GATT and NAFTA: Win, lose, or draw

Alex F. McCalla

The year 1993 was a banner year for the conclusion of trade agreements. Yet until the very end, the ratification of both GATT and NAFTA was in doubt. The negotiations under the GATT (General Agreement on Tariffs and Trade) Uruguay Round dragged on for seven years three months, and a broad agreement was reached only on the last day (December 15). NAFTA (North America Free Trade Agreement) was in doubt until the day of the U.S. House of Representatives vote. Each contains significant provisions relating to agricultural trade. In fact agriculture was clearly the contentious component of GATT and it was agricultural "understandings" (side agreements) that finally turned the tide on the NAFTA debate.

The GATT agricultural agreement was hailed by some as providing the most significant advances in agricultural trade liberalization since the abo-

lition of the Corn Laws. Others judged the agreement to be a "disappointing compromise" likely to have minimal impact. Clearly it must be a case of whether the glass is half-full or half-empty.

NAFTA's agricultural provisions are, in some eyes, limited because they reduce already low tariff barriers and exclude the big support items like dairy. Others judged NAFTA as a significant breakthrough in creating a continental agricultural market. Again who is right?

The good news is everybody could be right depending on what base for comparison is chosen. In the case of GATT, that there was any agreement, however modest, to bring agricultural trade under the discipline of GATT, is a significant advance compared to previous Rounds where agriculture was always left out at the end. While the quantitative reductions in internal support (20 percent), border protection (36 percent) and export assistance (36 percent in value of subsidies, 21 percent of volume) are modest indeed, the fact that nations have agreed to convert non-tariff barriers to tariffs and reduce them on average 36 percent, moves agriculture towards, rather than away from, a more liberal regime. The commitment to continue to move, after six years of transition, towards substantial progressive reductions in agricultural support is also positive.

But these changes are a far cry from the initial position of the United States (the zero option) and the Cairn's Group. Further, changes in domestic policies in the United States and the European Union which occurred during the course of the negotiations mean

that each party can meet the agreement's provisions relatively easily. Some will argue that the GATT negotiations caused domestic reform, especially in CAP. Others, with equal fervor, argue domestic changes were driven by domestic issues (i.e., budget costs).

In the case of NAFTA, big ticket program items like dairy were left out to be guided by GATT agreements. Unilateral liberalization already undertaken by Mexico to gain entry to GATT, and to implement Salinas' reforms, probably will have much greater impacts on trade than NAFTA *per se*. On the other hand, at the end of long transition periods, much of agricultural trade in North America will be free.

But surely the fundamental comparison must be against what would have happened if no agreements had been reached. Given that the dynamic tendency of countries and trade regimes is to retreat towards protectionism, agreements that move agriculture towards liberalization must be judged as successful. Earlier this year, I sounded a very pessimistic note about chances for liberalization (McCalla, Fellows Address). I am less pessimistic now, but I am still not a flaming optimist. Time will tell whether domestic interests will figure out new ways to protect domestic producers. Trade liberalization is a never ending fight against the "evil forces" of self-interest. Of course, that's good news for trade economists as there will be plenty of work in the years ahead.

Alex F. McCalla

Table of contents

Features

- 4 The Central Valley Water Project Improvement Act and water markets**
- 5 Two steps forward—one step back**
B. Delworth Gardner and John E. Warner
- 10 Water markets, individual incentives, and environmental goals**
Richard Howitt
- 14 Fruits, vegetables, and pesticide policy**
- 15 Yield and cost impacts of reduced persticide use on fruits and vegetables**
Ronald D. Knutson, Charles Hall, Edward G. Smith, Sam Cotner, and John W. Miller
- 19 Science and social advocacy: A dilemma for policy analysts**
Katherine Reichelderfer Smith
- 25 Group risk plan insurance: An alternative risk-management tool for farmers**
Alan E. Baquet and Jerry Skees
- 29 The flood of 1993: the economic aftermath**
Dan Cassidy and Rickert Althaus

Alex McCalla is professor of agricultural economics and management at the University of California, Davis. He writes extensively on agricultural policy and trade. He served for the past six years as chair of the Technical Advisory Committee (TAC) of the Consultative Group on International Agricultural Research (CGIAR).

B. Delworth Gardner is professor of economics at Brigham Young University, and professor emeritus of agricultural economics, University of California, Davis, where he also served as director of the Giannini Foundation of Agricultural Economics. Gardner was among the first to systematically study markets as a way to allocate water and showed the increase in water values when policy removes impediments to water transfers.

John Warner studied economics with an emphasis in natural resources at Brigham Young University. He currently works as a business strategy consultant at Monitor company.

Richard Howitt is professor of agricultural economics at the University

of California, Davis. He specializes in agricultural resource economics, including studies of markets in the reallocation of natural resources. Many of his publications focus on the economics of expanding water markets in California, the western U.S. and Europe.

Ron Knutson is professor and director of the Agricultural and Food Policy Center at Texas A&M University. He served as coordinator of the pesticide use reduction study, reported here, under the auspices of Knutson and Associates.

Charlie Hall is associate professor and extension economist in the Department of Agricultural Economics at Texas A&M University. He specializes in horticultural economics.

Ed Smith is Distinguished Roy B. Davis Professor of Agricultural Cooperation at Texas A&M University. Ed's extension activities focus on agricultural policy issues.

Sam Cotner is professor and associate head of the Department of Horticultural Sciences at Texas A&M University. In recent years his extension

activities relate to vegetable production throughout Texas.

John Miller is research associate in the Agricultural and Food Policy Center at Texas A&M University. John's graduate studies and research focus on agricultural policy.

Katherine Reichelderfer Smith is director of the Policy Studies Program at the Henry A. Wallace Institute for Alternative Agriculture. She served as an administrator at the USDA's Economic Research Service. She has long been an active analyst of agroenvironmental policy issues.

Alan E. Baquet is associate professor in the Department of Agricultural Economics and Economics, Montana State University, Bozeman, Montana. His primary responsibility involves extension education and research in farm management. He leads the national education effort for the Federal Crop Insurance Corporation's Group Risk Plan Insurance Program.

Jerry Skees is a professor in the Department of Agricultural Economics at

the University of Kentucky. His research and teaching program focus on agricultural policy. He served as research director for the Crop Insurance Commission and as a visiting scholar for the Economic Research Service (ERS). In recent years, he helped develop the Group Risk Plan for the Federal Crop Insurance Corporation.

Dan Cassidy is Director of Public Affairs and Development for the Food and Agricultural Policy Research Institute (FAPRI) at the University of Missouri-Columbia. He served as the Deputy Director of the Missouri Department of Agriculture and Legislative Assistant for Agriculture for United States Senator Christopher S. Bond.

Rickert Althaus is associate professor of political science at Southeast Missouri State University, where he teaches in the areas of public policy and public administration.
