EXECUTIVE SUMMARY

1994 ANNUAL REPORT OF THE SOUTHWESTERN MINNESOTA FARM BUSINESS MANAGEMENT ASSOCIATION

by

Kent D. Olson, Dary E. Talley, James Christensen,
Erlin J. Weness, and Perry A. Fales

For the Southwestern Association, average net farm income was \$31,915 in 1994 for the 202 farms included in this report (Table 1, pages 10-11, and Figure 1). This was an increase of 1% from 1993. In both nominal terms and when adjusted by the Consumer Price Index (CPI-U) to a constant 1994 dollar, farmers have had much lower incomes in the past four years (i.e., 1991-1994) than the prior five years (i.e., 1986-1990). (Net farm income is calculated by subtracting total cash farm expense and depreciation from gross cash farm income and adjusting for changes in inventory items.

Figure 1. Average Net Farm Income

As in previous years, the actual profit levels experienced by individual farms can vary greatly from the overall average profit of \$31,915. The high 20% of these farms had an average profit of \$93,592 which is a decrease from 1993. The low 20% of the farms had an average loss of \$-20,296 in 1993, which was a small improvement from 1993.

Average gross cash farm income in 1994 was \$306,175. This was an increase of 3% from 1993. Four sources of sales made up 74% of total income in 1994: hogs, beef finishing, corn, and soybeans (Figure 2). Compared to 1993, beef finishing sales increased by \$16,654. Soybean sales increased by \$7,405. Given the low hog prices in late 1994, it is not surprising that hog sales decreased by \$7,438 (or 11%) compared to 1993.

Government payments (of all types) decreased from an average of \$27,754 in 1993 to \$21,987 in 1994. As a percentage of total income, government payments decreased from 9% in 1993 to 7% in 1994. Insurance income decreased by \$7,141 but had been high in 1993 due to the poor weather.

Cash expenses also increased to an average of \$256,246 in 1994. This was an increase of 6% from 1993. As a percentage of both cash expenses and depreciation in 1994, feeder purchases and feed expenses dominated but were stable comparing 1994 and 1993 percentages (Figure 3). Expense categories which increased the most in percentage were: seed, fertilizer, and crop chemicals; interest; and depreciation. Average labor or expenses decreased in dollars as well as a percentage of the total.

Both the rate of return on assets (ROA) and the rate of return to equity (ROE) increased slightly from 1993 (Figure 4). ROA averaged 5% and ROE was 3% using assets valued on a cost basis (Table 4, page 14). Compared to the late 1980s, ROE continued to be lower than ROA indicating that debt capital was more expensive than it was beneficial.

Figure 4. Rates of Return on Assets (ROA) and Equity (ROE)

Two key measures of solvency have continued to increase. Using a market value basis, average total equity (of the sole proprietors) was \$470,418 at the end of 1994: an increase of \$18,297 during the year (Table 5, page 16). Average equity continues to improve since 1987 (Figure 5). However, the average debt-asset ratio has increased slightly again to 48% at the end of 1994.

Figure 5. Ending Equity and Ending Debt-Asset Ratio

The report provides additional information on profitability, liquidity, and solvency as well as other whole-farm information and detailed information on crop and livestock enterprises. Also reported are whole-farm financial condition and performance by county, sales size class, and type of farm and corn and soybean returns by county.

1994 ANNUAL REPORT OF THE SOUTHWESTERN MINNESOTA FARM BUSINESS MANAGEMENT ASSOCIATION

by
Kent D. Olson, Dary E. Talley, James Christensen,
Erlin J. Weness and Perry A. Fales¹

This report summarizes the individual farm records of the members of the Southwestern Minnesota Farm Business Management Association for 1994.

Whole-farm information and enterprise costs and returns are reported. The year-end analysis of the individual farms was performed by the fieldman using FINPACK 8.0 from the Center for Farm Financial Management within the Department of Agricultural and Applied Economics. The individual analyses were summarized at the Department of Agricultural and Applied Economics using FINANSUM. In addition to the average of all farms, the averages for the high and low income groups are also presented. The tables are divided into three major groups. Tables 1 through 10 present whole-farm information. Tables in the 11-x series provide information on crop enterprises. Tables in the 12-x series provide information on livestock enterprises. Table 13 contains information on the prices used in the analysis. A summary of the average whole-farm information over time is presented in Table 14. Tables 15, 16, 17 and 18 categorize the whole-farm information by county, gross income class, type of farm, and operator age, respectively.

Of the 220 farms in the Southwestern Association, the data for 202 farms are included in this report. The rest were omitted because the records were incomplete at the time that this report was prepared. In two separate studies the farmers who belong to a management association were found to be larger than the average farm reported by the agricultural census and were more likely to have livestock.

In addition to this report, members receive an annual farm business analysis; on-farm instructional visits; end-of-year income tax planning and preparation; periodic meetings, tours, and seminars; a monthly newsletter; and other managerial and educational assistance. Each farmer pays an annual fee which covers a large part of the cost, with the balance defrayed by the Minnesota Extension Service and research programs of the University of Minnesota.

¹Olson is an Associate Professor, University of Minnesota-Twin Cities; Talley, Christensen, Weness and Fales are Farm Management Extension Agents and Fieldmen for the Association. The review and helpful comments of Vernon Eidman, Earl Fuller and Dale Nordquist are greatly appreciated.

EXPLANATORY NOTES FOR THE WHOLE-FARM REPORTS

Tables 1 through 4, and 6 through 8 include the same number of farms, which were all of the farms whose records were judged to be of sufficient quality. Table 5, the Balance Sheet, includes only sole proprietors; partnerships and corporations are excluded because some debt is held outside of the business causing potential misinterpretations of the average financial condition. The number of farms included in each of the crop and livestock tables varies because all farms do not have the same enterprises. Some farmers' records were complete enough to be included in the whole-farm tables, but at times, these same farmers' crop or livestock records were not complete enough to include in the respective crop or livestock tables.

Rounding of individual items may have caused minor discrepancies between those items and the printed totals which are calculated before rounding.

Table 1. Farm Income Statement

This statement is a summary of income, expenses, and resultant profit or loss from farming operations during the calendar year. The first section of Table 1 lists cash farm income from all sources. The second section of Table 1 lists cash expenses. "Interest" includes only interest actually paid. No opportunity charges on farm equity capital or unpaid labor are included. The difference between "Gross Cash Farm Income" and "Total Cash Expense" is the "Net Cash Farm Income." This is net farm income on a cash basis.

The third and fourth sections of Table 1 deal with noncash changes in the farm business. The "Inventory Changes" and "Depreciation and Other Capital Adjustments" sections are used to convert the cash income statement (Net Cash Farm Income) derived from the first two sections into an accrual income statement. The resulting "Net Farm Income" represents the return to the operator's and family's unpaid labor, management, and equity capital (net worth). In other words, it represents the return to all of the resources which are owned by the farm family and, hence, not purchased or paid a wage. However, it does not include any asset appreciation, debt forgiveness or asset repossessions.

Table 2. Inventory Changes

This is the detailed statement of inventory changes which is summarized in Table 1. It includes beginning and ending inventories and the calculated changes.

Table 3. Depreciation and Other Capital Adjustments

This is the detailed statement of depreciation and other capital adjustments which is summarized in Table 1. It includes beginning and ending inventories, sales, repossessions, purchases, and depreciation.

Table 4. Profitability and Liquidity Analysis

Various measures of performance are calculated for the farms in this report. These include measures of profitability and liquidity. (Solvency measures are in Table 5.) In Tables 1-3, no opportunity costs are used. In Table 4, opportunity costs for labor, capital, and management are used. Changes in market value of assets are used in calculating the market values of these measures. The measures and their components are described below.

Profitability

Profitability is measured in both cost and market basis (if that information is available) in Table 5.

"Labor and management earnings" equals "Net Farm Income" from Table 1 minus an opportunity interest cost of 6% on average farm net worth.

"Rate of return on assets" is the "Return to farm assets" divided by "Average farm assets."

"Rate of return on equity" is the "Return to farm equity" divided by "Average farm equity."

"Operating profit margin" is the "Return to farm assets" divided by "Value of farm production."

"Asset turnover rate" is the "Value of farm production" divided by "Average farm assets."

"Interest on farm net worth" is the "Average farm net worth" multiplied by a 6% opportunity interest cost charge.

"Farm interest expense" is the accrued interest cost so it will be different from the cash interest paid shown in Table 1.

"Value of operator's labor and management" is its opportunity cost. It is evaluated using the suggested values listed in Table 13.

"Return on farm assets" is calculated by adding "Farm interest expense" and "Net farm income" and then subtracting the "Value of operator's labor and management."

"Average farm assets" is the average of beginning and ending total farm assets.

"Return to farm equity" is calculated by subtracting the "Value of operator's labor and management" from "Net farm income."

"Average farm equity" is the average of beginning and ending farm net worth.

"Value of farm production" is gross farm income minus feeder livestock purchased and adjusted for inventory changes in crops, market livestock and breeding livestock.

Liquidity: Cash Basis

"Family Living and Taxes" is the apparent total family expenses and income and social security taxes paid from Table 7.

"Real estate principal income is taken from the farmer's data.

"Cash available for intermediate debt service" on the cash basis is "Total net income" minus "Family living and taxes" and "Real estate principal payments."

"Average intermediate debt" is the average of beginning and ending intermediate farm liabilities.

"Years to turn over intermediate debt" is "Average intermediate debt" divided by "Cash available for intermediate debt service." If either the cash-based or accrual-based "Cash available for intermediate debt" is a negative number, debt repayment is not possible because of negative cash flow and "Years to turn over intermediate debt" cannot be calculated.

"Expense as a percent of income" is "Total cash expense" divided by "Gross cash farm income."

"Interest as a percent of income" is "Interest" divided by "Gross cash farm income."

Liquidity: Accrual Basis

"Cash available for intermediate debt service" on the accrual basis is "Total net accrual income" minus "Family living and taxes" and "Real estate principal payments."

"Accrual expense as a percent of income" is "Total accrual farm expense" divided by "Total accrual farm income."

"Interest as a percent of income" is "Interest" minus beginning accrued interest plus ending accrued interest divided by "Total accrual farm income."

Table 5. Balance Sheets

The beginning and ending balance sheets and solvency measures are presented in Table 5. This table includes only sole proprietors; partnerships and corporations are excluded because some debt is held outside of the business causing potential misinterpretations of the average financial condition. If the data is available, both cost and market value balance sheets are reported.

Table 6. Statement of Cash Flows

This table reports the sources from which cash was available or obtained and where that cash was used or remains at the end of the year.

Table 7. Financial Guidelines Measures and Labor Analysis

This table contains two sections: first, the financial measures and, second, the labor summary. In the first section, the Farm Financial Standards Task Force's 16 financial measures for evaluating a farm's financial position and performance are reported. These 16 measures are explained below following the descriptions found in the FINPACK manual.

Liquidity

The "current ratio" is calculated by dividing the total current farm assets by the total current farm liabilities.

"Working capital" is calculated by subtracting current farm liabilities from current farm assets.

Solvency (Market)

The "farm debt to asset ratio" is calculated by dividing the total farm liabilities by the total farm assets. It is similar to the total percent in debt ratio listed earlier. The difference is that nonfarm assets and liabilities are included in the total percent in debt but not in the farm debt to asset ratio.

The "farm equity to asset ratio" is calculated by dividing farm equity or net worth by the total farm assets. It measures the proportion of the farm assets financed by the owner's equity as opposed to debt. This is the opposite of the debt to asset ratio. These two measures always add up to 100% because they describe how total farm assets are financed.

The "farm debt to equity ratio" measures farm debt relative to farm equity. It is calculated by dividing the total farm liabilities by the total farm net worth. The debt to equity ratio measures the amount of borrowed capital being employed for every dollar of equity capital.

Profitability

The "rate of return on farm assets" can be thought of as the average interest rate being earned on all investments in the farm or ranch business. If assets are valued at market value, the rate of return on assets can be looked at as the "opportunity cost" of farming versus alternate investments. If assets are valued at cost value, the rate of return on assets more closely represents the actual return on the average dollar invested in the farm. The rate of return on farm assets is calculated as follows: $\text{Rate of Return on Assets} = \text{Return on Farm Assets} \div \text{Average Farm Investment}$, where: $\text{Return on Farm Assets} = \text{Net Farm Income} + \text{Farm Interest} - \text{Value of Operator's Labor \&}$

Management, and Average Farm Investment = (Beginning Total Farm Assets + Ending Total Farm Assets) \div 2.

The "rate of return on farm equity" represents the interest rate being earned on your farm net worth. If assets are valued at market value, this return can be compared to returns available if the assets were liquidated and invested in alternate investments. If assets are valued at cost value, this more closely represents the actual return on the funds that have been invested or retained in the business. The rate of return on farm equity is calculated as follows: Rate of Return on Equity = Return on Farm Equity \div Average Farm Net Worth, where: Return on Farm Equity = Net Farm Income - Value of Operator's Labor & Management, and Average Farm Net Worth = (Beginning Farm Net Worth + Ending Farm Net Worth) \div 2.

"Operating profit margin" is a measure of the operating efficiency of the business. It is calculated as follows: Operating Profit Margin = Return to Farm Assets \div Value of Farm Production. If expenses are held in line relative to the value of output produced, the farm will have a healthy net profit margin. A low net profit margin may be caused by low prices, high operating expenses, or inefficient production.

"Net farm income" represents the returns to unpaid labor, management, and equity capital invested in the business.

Repayment Capacity

The "term debt coverage ratio" measures whether the business generated enough cash to cover term debt payments. It is calculated by dividing the funds generated by the business for debt repayment (net cash farm income + nonfarm income + interest expense - family living expense - income taxes) by total term debt payments (annual scheduled principal and interest payments on intermediate and long term debt). A ratio less than 100 percent indicates that the business did not generate sufficient cash to meet scheduled payments in the past year. A ratio greater than 100 indicates the business generated enough cash to pay all term debt payments.

The "capital replacement margin" is the amount of money remaining after all operating expenses, taxes, family living costs, and scheduled debt payments have been made. It is the cash generated by the farm business that is available for financing capital replacement such as machinery and equipment. FINAN calculates the capital replacement margin by first adding interest due on intermediate and long term loans to the amount available for principal payments. It then subtracts scheduled principal and interest payments from this total.

Efficiency

"Asset turnover rate" is a measure of efficiency in using capital. It is calculated as follows: Asset Turnover Rate = Value of Farm Production \div Total Farm Assets. This will be a market or cost rate depending on how the assets are valued.

The last four ratios reflect the distribution of gross income to cover operating expenses and generate farm income. The sum of the operating expense ratio, the depreciation expense ratio, and

the interest expense ratio equals the percent of gross income used to pay business expenses. The amount remaining is net farm income. The gross farm income used to calculate these ratios is the accrual gross farm income.

The "operating expense ratio" is calculated as $(\text{Total Farm Operating Expense} - \text{Farm Interest Expense}) \div \text{Gross Farm Income}$. This ratio indicates the percent of the gross farm income that was used to pay operating expenses. Total farm operating expense is the accrual total operating expense.

The "depreciation expense ratio" is calculated as $\text{Depreciation} \div \text{Gross Farm Income}$. This ratio indicates the percent of the gross farm income that was used to cover depreciation and other capital adjustments.

The "interest expense ratio" is calculated as $\text{Farm Interest Expense} \div \text{Gross Farm Income}$. This ratio indicates the percent of the gross farm income used for farm interest expenses. This is the same ratio as the accrual interest as a percent of income from the Liquidity section in Table 4.

The "net farm income ratio" is calculated as $\text{Net Farm Income} \div \text{Gross Farm Income}$. This ratio indicates the percent of the gross farm income that remained after all expenses.

Table 8. Crop Production and Marketing Summary

This table contains three sections. The first section reports average acreage by land use. The next two sections show average price received and average yields for major crops.

Table 9. Household and Personal Expenses

For those farms that kept records, the household and personal expenses are summarized in Table 9. The farms are grouped based on profit as in Table 1. Since not all farms keep these records, the number of farms may be different for each group. Averages are determined by the number of farms keeping these records.

Table 10. Nonfarm Income and Operator Information

Table 10 reports the averages for the number of operators per farm, the operator's age, and the number of years farming. This table also reports the income from nonfarm sources which is included in a farmer's total net income. Not all farms have nonfarm income, but the figure reported is the average over all farms not just those reporting nonfarm income. Also reported are the beginning and ending values for nonfarm assets for all farms (not just sole proprietors as in Table 5).

EXPLANATORY NOTES FOR CROPS TABLES

The "Crop Enterprise Analysis" tables show the average physical production, gross return, direct costs, overhead costs, and net returns per acre. All costs are actual costs; no opportunity costs are included. The "Net Return per Acre" is the "Gross Return per Acre" minus the direct and overhead costs. The last section of each crop table contains economic efficiency measures and the net return per acre including government payments and a charge for unpaid over labor and management.

There are potentially three tables for each group depending on the farmer's tenure on the land: owned land, cash rented land, and share rented land. It is possible for an individual farm to have data in all three tables if all three land tenure categories are represented in that farm business. Farms are classified into low 20% or high 20% on the basis of returns to overhead costs. The classification is done separately for each table.

To estimate the return to crops in the government programs, the return to overhead and the net return including setaside income (and expenses) is estimated and included in the appropriate tables. This is done by allocating the deficiency payments and the expenses reported in the set aside enterprise to the program crop and then dividing by the total of the production and set aside acres.

The "net return over labor and management" is calculated by allocating the farmer's charge for unpaid labor and management and subtracting it from the "net return per acre (including setaside)."

Rounding of individual items for the report may have caused minor discrepancies with the calculated totals.

EXPLANATORY NOTES FOR LIVESTOCK TABLES

The "Livestock Enterprise Analysis" tables show the average physical production, gross returns, direct costs, overhead costs, and net returns per budget unit. All costs are actual costs; no opportunity costs are included. The "Net Return" to the enterprise is the "Gross Return" minus the direct and overhead costs. The last section of each livestock table contains both economic and technical efficiency measures.

The "Dairy" table contains the information for only the milking herd (which includes dry cows). "Dairy Replacement Heifers" are those heifers kept for replacement into the milking herd. "Dairy Steers" includes only steers for feeding. The "Dairy and Replacement Heifers" table is for the whole herd and includes those farms in the "Dairy" and "Dairy Replacement Heifers" tables; it does not include "Dairy Steers."

The "All Beef Finish Calves" table includes the FINPACK codes for beef steer and heifer calf finishing; there was no yearling finishing.

When there is a sufficient number (i.e., more than 24), farms are divided into low 20% and high 20% on the basis of returns to overhead costs. The classification is done separately for each livestock enterprise.

"Lbs. feed per lb. of gain" is the lbs. of total feed divided by "Total production." For grains, these pounds per bushel are used: corn, 56; oats, 32; barley, 48; grain sorghum, 56; wheat, 60; and millet, 48. For these forages, the pounds are calculated by these factors: alfalfa haylage, 0.5; corn silage, 0.33; oatlage, 0.5; and sorghum silage, 0.33; and small grain silage, 0.33.

The calving and weaning percentages are calculated as the number of calves which are calved and weaned, respectively, divided by the number of cows which are supposed to bear young.

Rounding of individual items for the report may have caused minor discrepancies with the calculated totals.

TABLE 13
PRICES USED IN ANALYSIS - 1994
SOUTHWESTERN FARM BUSINESS MANAGEMENT ASSOCIATION

<u>Item</u>	<u>Beginning Inventory</u>	<u>Feed</u>	<u>Harvest</u>	<u>Ending Inventory</u>
Corn/bu.	2.50	2.00	1.80	1.80
Oats/bu.	1.25	1.10	1.10	1.10
Wheat/bu.	4.00	3.50	3.25	3.75
Soybeans/bu.	6.50	5.50	5.00	5.15
Alfalfa hay/t.	70.00	70.00	70.00	70.00
Haylage/t.	35.00	35.00	35.00	35.00
Other hay/t.	60.00	60.00	60.00	60.00
Corn silage/t.	17.00	17.00	17.00	17.00
Grass silage/t.	13.00	13.00	13.00	13.00
Oat silage/t.	14.00	14.00	14.00	14.00
Oat straw/bale	1.50	1.50	1.50	1.50
Green chop/t.		14.00		
Cornstalks/t.		7.00		
Def.Pmt.Corn/A	.00		.60	.40
Def.Pmt.Wheat/A	.00		.35	.00
CCC Corn loan equity	.90	(for cash basis only)		.05
CCC Soybean loan equity	1.75	(for cash basis only)		.40

Corn and wheat setaside income/acre calculation: (ASCS yield X 85% of crop base X estimated deficiency payment)

The value of harvested crop on setaside acres is included as "other income" on the setaside enterprise.

To correct for low test weights on corn use: Bu. X test weight/56 lbs.

Pasture/head/month:

Cows	7.00	Sheep	1.00
Calves	3.50	Lambs	.60

Board for hired labor	\$6.00/day or \$1.50/meal
Value of milk used in home	\$.40/qt. or \$1.60/gal.
Value of milk fed calves	\$1.50/gallon

Value of operator's labor \$25,000

Suggested land market value by county:

Cottonwood	1,500
Jackson	1,500
Faribault	1,800
Martin	1,600
Murray	800
Nobles	1,200
Pipestone	700
Redwood	1,400
Watonwan	1,600

Land prices may be modified according to each farm situation. Building and dwelling valuations should be based on fair market value.

EXPLANATORY NOTES FOR SUMMARY TABLES

A better picture of the current profitability, liquidity and solvency conditions can be seen by comparing this year to previous years (Table 14). All items are taken from the annual report for that year. Monetary values are left in nominal terms unadjusted for inflation. The one exception is the "Net Farm Income (Constant 1993 \$)" using the Consumer Price Index (CPI-U) from the U.S. Department of Commerce. This shows the changes in "buying power" for the farmers.

The debt-to-asset percentage measures the degree to which assets are financed by external sources. The year-end total assets is divided by year-end total liabilities to obtain this measure. The Southwestern Association used a "conservative market value" for land from 1979 to 1992, but switched to a (full) market value in 1993.

Starting with 1983, financial analysis was done by FINPACK. This new program added new measures which had not been available previously and in some cases used slightly different formulas.

To evaluate current financial performance in other ways, the whole-farm analysis is summarized on a county basis (Table 15), on a gross income category basis (Table 16), by type of farm (Table 17), and by age of operator (Table 18). Farms are classified as a certain type (e.g., dairy) on the basis of having 70 percent or more of their gross sales from that category.

<u>Year</u>	<u>CPI-U</u> <u>1982-84=100</u>	<u>Adjusted CPI-U</u> <u>1994=100</u>
1980	82.4	55.6
1981	90.9	61.4
1982	96.5	65.1
1983	99.6	67.2
1984	103.8	70.1
1985	107.5	72.6
1986	109.6	74.0
1987	113.6	76.7
1988	118.3	79.9
1989	124.0	83.7
1990	130.7	88.3
1991	136.2	92.0
1992	140.3	94.7
1993	144.5	97.6
1994	148.1	100.0
