ECONOMIC GROWTH IN MINNESOTA COMPARED TO NEIGHBORING STATES AND THE NATION AS A WHOLE AND PROJECTIONS TO 1980 AND TO 1990

Terri Erickson and John D. Helmberger

Staff Papers are published without formal review within the Department of Agricultural and Applied Economics

Economic Growth in Minnesota Compared to Neighboring States and the Nation as a Whole and Projections to 1980 and to 1990.

Terri Erickson and John D. Helmberger*

Many people believe that Minnesota's economy is lagging relative to neighboring states and the U.S. as a whole. This belief is based on two facts:

(1) Minnesota's per capita income is and has been lower than the national average $\frac{1}{2}$, and (2) Minnesota's population growth has been slower than for the nation as a whole. (Its birth and death rates were similar but there has been net-out-migration.) However, these facts do not mean that Minnesota's economy is lagging.

Minnesota's per capita income has been lower than the national average, but it has been growing faster. (Japan's per capita income is and has been lower than that for the U.S. But, as is well known, Japan's per capita income has been growing much faster. Almost no one believes Japan's economy is lagging Its growth is a remarkable success story.) But why is Minnesota's per capita income lower than the national average? This is true largely because agriculture is relatively twice as important in Minnesota as it is in the nation as a whole and farm incomes have been historically lower than non-farm incomes. In 1929, Minnesota's farm income accounted for 13.9% of its personal income while such income accounted for 6.9% of U.S. personal income. These figures declined to 4.60% and 2.3%, respectively, by 1970. Generally, states, in which agriculture is relatively important, have lower per capita incomes.

^{*} Research Assistant and Professor respectively in the Department of Agricultural and Applied Economics, University of Minnesota, St. Paul. This paper is an updating of Staff Papers published in 1972 and 1974 plus projections which did not appear in earlier papers.

^{1/} Actually Minnesota's per capita income was (temporarily) larger than the national average in 1973 because of the spurt in farm income occasioned by the large grain imports made by Russia and China during that year.

Minnesota's population has grown slowly because of net-out-migration. why has there been net-out-migration? The technological revolution in agriculture (the use of larger and more machinery, the development of improved plants and animals, the use of improved herbicides and insecticides, the greater use of commercial fertilizers, etc.) has so improved productivity in farming that fewer and fewer farmers are needed to produce the nation's food and fiber - so there has been an exodus of people from rural America. Those states which had (or have) relatively more farmers and relatively less urban population than the average for the nation experienced (or are experiencing) net-out-migration. All of the states which had relatively more than their share of farmers experienced net migration except Virginia, which is a special case because of the spillover of population from Washington, D.C. The more important farming is in a state, the greater the out-migration. Wisconsin and all the other Plains States, except Missouri, experienced a greater rate of out-migration than did Minnesota and all had a smaller rate of increase in personal income than did Minnesota between 1927-29 and 1972-74. All had a smaller increase between 1953-55 and 1972-74 except North Dakota. The more recent period 1968-70 and 1972-74 found Minnesota's personal income growing faster than Wisconsin and Missouri. Personal income in the other Plains States grew faster than it did in Minnesota - thanks to the (temporary?) spurt in farm income. In these states agriculture is relatively even more important than it is in Minnesota.

Despite the above, the available data show clearly that Minnesota's economy has not lagged, and Department of Commerce projections are very favorable. Section I provides the relevant statistics for Minnesota as compared with those of other Plains States (Iowa, Missouri, North Dakota, South Dakota, Nebraska, and Kansas), with adjoining Wisconsin, and the U.S. as a whole in Tables 1.1 - 1.5, below. Section II summarizes projections made for all the states by the Department of Commerce to 1980 and to 1990.

Section I: The Historical Record

Minnesota's total personal income increased 1,193% from the 3 year average, 1927-29, to the 3 year average, 1972-74, compared to an increase of 1,183% for the U.S. as a whole. The rate of growth from the mid-fifties to 1972-74 was also greater for Minnesota than for the U.S.; 265% and 257%, respectively, as was the case comparing the 3 year average 1968-70 with the 3 year average 1972-74, 43% and 40%, respectively. The Department of Commerce uses 3 year averages when comparing growth rates among the states since the degree of reliance on agriculture varies greatly and income from agriculture is highly variable. A state may look like it is doing very well (or very badly) if single year figures are compared because it had a very good crop year (or bad one) or because farm prices were high (or low). (See Table 1.1). Minnesota's growth has been especially good considering the fact that it has more than its proportionate share of farmers (whose incomes have been lower than urban incomes until recently) and it experienced net-out-migration which added personal income in other states while subtracting it from Minnesota.

Growth in personal income per capita is a better measure of welfare than the increase in total personal income. It is increasing income per capita that measures material well-being. Table 1.2 reveals that per capita personal income in Minnesota increased 750% between the 3 year period 1927-29 and the 3 year period 1972-74 while it increased 635% in the U.S. as a whole. Per capita income in Minnesota increased from \$598 in 1929 to \$5,422 in 1974 while per capita income for the U.S. as a whole increased from \$703 to \$5,448. Minnesota's per capita income gained both absolutely and relatively. The (short run) spurt in farm income had brought Minnesota's per capita income, at least temporarily, above the U.S. average in 1973 (\$5,106 and \$5,023). Of the 7 Plains States and Wisconsin, Minnesota had a higher per capita income for the 1972-74 period than

did Missouri and South Dakota, approximately the same per capita income as:
Wisconsin, Iowa and Nebraska, and a smaller one than North Dakota and Kansas
In the 1927-29 period, two states of the 8 in the area, Wisconsin and Missouri,
had a higher per capita income than Minnesota; in the 1953-55 period states,
Wisconsin, Missouri, and Kansas, had a higher per capita income; in the period
1968-70 only Kansas had a higher per capita income.

Average weekly wages in manufacturing are greater in Minnesota than the national average and manufacturing payrolls in Minnesota have been growing faster than the national average. Such payrolls increased 1,805% in Minnesota between 1929 and 1974 while the U.S. manufacturing payrolls increased 1,217%. Of the neighboring states, only Kansas, Iowa, and North Dakota had more rapid rates of growth in manufacturing. Minnesota had a larger absolute growth than did those states.

Between 1970 and 1971, manufacturing payrolls in Minnesota dropped from \$2,698 million to \$2,669 million (Department of Commerce data) while such payrolls increased in each of the neighboring states and in the U.S. as a whole. This drop is due to the national policy changes which sharply reduced the demand for electronics equipment which is a substantial part of Minnesota's manufacturing. Recall how hard Honeywell was hit by the change! Thus the 34.88% increase in manufacturing payrolls in Minnesota between 1970 and 1974 masks a 1.1% decrease from 1970 to 1971 followed by a recovery of 10.12% between 1971 and 1972. Manufacturing payrolls actually increased 36.34% between 1971 and 1974. Between 1972 and 1974 manufacturing payrolls increased faster in Minnesota than the national average though not as fast as in neighboring states. (See Table 1.3).

Employment in manufacturing in Minnesota grew more rapidly than it did in the U.S. as a whole whether we measure the rate of growth from 1940 to 1973, 1950 to 1973, 1960 to 1973, or 1970 to 1973. The rate of growth in such employment

was also generally higher than in neighboring states - until recently because of the setback in 1971. Since 1960, only the Dakotas, among the 8 states of the area, experienced a more rapid rate of growth in manufacturing employment than Minnesota. In absolute terms, manufacturing empolyment increased by 101,000 in Minnesota between 1960-1973 while it increased 12,000 in the Dakotas combined. Half of the severe drop in manufacturing employment in Minnesota between 1970 and 1971 is accounted for by the decline in employment in the electrical machinery industry. Between 1971 and 1972, manufacturing employment in Minnesota increased again, faster than the national average but not as fast as its neighbors.

However, the electrical machinery industry has fully recovered since then.

Between 1972 and 1973, total manufacturing employment increased 6.5% in Minnesota while it increased less than 5% nationwide. (See Table 1.4).

Between the years 1949-51 and 1972-74, Minnesota's realized net farm income grew faster (196%) than the national average (83%). Among the other Plains States and Wisconsin, farm income grew faster than Minnesota only in North Dakota. (See Table 1.5).

Expansion in such growth industries as electronics and other industries that require highly skilled and professional labor suggest that Minnesota's prospects for growth at a rate greater than average are good. This goes for growth in total personal income, despite continued out-migration (if it continues), as well as for growth in farm income, nonfarm income and per capita personal income.

Whether we measure growth by total personal income, per capita personal income, manufacturing payrolls, employment in manufacturing, nonfarm income, or farm income, Minnesota's rate of growth has been faster than the national average.

Section II: Projections

The U.S. Department of Commerce in Area Economic Projections 1990 has made projections of growth by industry, by SMSA, and by state to 1980 and to $1990.\frac{1}{}$. This is the second set of such projections. The first was made in 1972 and published in the Survey of Current Business, April, 1972. The Department plans to update the projections every five years.

The projections discussed here are "keyed to the Census Bureau's series "E" national population projection and, in addition, embodied updated historical data and revised (from the 1972 set of projections) projection procedures. The series "E" population projection assumes a fertility rate in 1990 roughly the same as the current rate." $\frac{2}{}$

The projections assume no policy changes of an unusual nature or magnitude before 1990. It envisages continued (though decelerated) rural to urban migration. It takes into account to some degree the changing energy costs, abstracts from business cycles, assumes maintenance of "reasonably full employment" (4% unemployment), abstracts from wars, assumes technological progress to support a 2.9% annual increase in productivity per man hour and takes environmental control into account. 3/

The tables that follow this introduction show projections from 1969 to 1980 and 1969 to 1990 in the following variables by state: (1) population, (2) total employment, (3) personal income, (4) per capital personal income, (5) total earnings which exclude property income and transfer payments, (6) earnings in agriculture, (7) earnings in manufacturing, (8) earnings from government,

(9) earnings from Federal government, and (10) earnings from State and Local

^{1/} Bureau of Economic Analysis, Social and Economic Statistics Administration, U.S. Department of Commerce.

 $[\]frac{2}{}$ Ibid., p. 1.

^{3/} Ibid., p. 5.

government. All dollar figures in the tables are in 1967 dollars. Each table shows the percentage increases, by state, in each of the variables from 1969-1980 and from 1969-1990 and ranks the states by percentage increases projected. The data were taken from pages 218-237 from Area Economic Projections 1990. The last year for which historical data are given is 1971. The tables make the projections from 1969 to facilitate comparison with the projections made by the Department of Commerce in 1972 when 1969 was the latest year for historical data. 1/2

The projected rates of growth to 1980 or to 1990 are higher for Minnesota than for the U.S. as a whole in every category except population. Minnesota's projected rate of growth to 1980 is also higher than any other midwestern state in the case of total personal income, per capita income, total earnings, and earnings in government and its rates of growth in the other variables were among the highest in the midwest. The comparison of projections to 1990 between Minnesota and the other midwest states is similar to the comparison for 1980.

The following table summarizes the projected rates of growth from the tables in the appendix.

^{1/} The 1972 projection tables, paralleling those which appear here, are available on request.

A Summary of Projected Rates of Growth:

Minnesota Compared to the U.S. and the Midwest* Projections Compared to the U.S. and the Other 11 States Minnesota

1. 2. 2. 5. 6.	Variable Population Lower than the U.S. rest of the Midwest and Indiana. Total Employment Total Personal Income Higher than the U.S rest of the Midwest in Agriculture** Higher than the U.S rest of the Midwest in Agriculture** Higher than the U.S rest of the Midwest in Agriculture** Higher than the U.S rest of the Midwest in Agriculture** Higher than the U.S rest of the Midwest Dakota and possibly	Iower than the U.S. but higher than the rest of the Midwest except Michigan, Ohio and Indiana. Higher than the U.S. and higher than the rest of the Midwest except Michigan and Indiana. Higher than the U.S. and higher than the rest of the Midwest. Higher than the U.S. and higher than the rest of the Midwest. Higher than the U.S. and higher than the rest of the Midwest. Higher than the U.S. and higher than the rest of the Midwest. Higher than the U.S. and higher than the rest of the Midwest except Kansas, South Dakota and possibly North Dakota.**	Lower than the U.S. but higher than the rest of the Midwest except Michigan and Indiana. Higher than the U.S. and higher than the rest of the Midwest except Michigan and Indiana. Higher than the U.S. and higher than the rest of the Midwest. Higher than the U.S. and higher than the rest of the Midwest except South Dakota. Higher than the U.S. and higher than the rest of the Midwest. Higher than the U.S. and higher than the rest of the Midwest. Higher than the U.S. and higher than the rest of the Midwest except Kansas, South Dakota and possibly North Dakota.**
7.	Earnings ın Manufacturing	Higher than the U.S. and higher than the rest of the Midwest except the Dakotas and Nebraska. (Minnesota's absolute projected increase is more than 3 times as large as the Dakotas and Nebraska combined).	Higher than the U.S. and higher than the rest of the Midwest except the Dakotas and Nebraska. (Minnesota's absolute projected increase is more than 3 times as large as the Dakotas and Nebraska combined).
φ .	Earnings in Government	Higher than the U.S. and higher than the rest of the Midwest.	Higher than the U.S. and higher than the rest of the Midwest.
9.	Earnings in Federal Government	Higher than the U.S. and higher than the rest of the Midwest except Wisonsin.	Higher than the U.S. and higher than the rest of the Midwest.
10.	Earnings in State and Local Government	Higher than the U.S. and higher than the rest of the Midwest except Illinois.	Higher than the U.S. and higher than the rest of the Midwest except Illinios.
* * *	The Great Lakes States, Michigan, Ohio, Indiana, North Dakota, South Dakota, Nebraska, and Kansas Rates of growth for North Dakota are missing sin	Illinoıs, Wisconsin and th ce no data were published	ee Plains States, Minnesota, Iowa, Missouri for the base year, 1969, for that state.

Total earnings are measured by place of work, as are all other earnings data. The difference between total income and total earnings is the sum of property income and transfer payments, less personal contributions for social insurance, plus an implicit commuting adjustment.
