## Introduction

The objective of this report is to provide estimates of the volume of Minnesota grains and oilseeds by county that will be surplus to local feeding requirements and will require transportation to regional and national markets in the years 1990 and 2000. The intent is to provide a document that can facilitate the planning process of public and private entities that are concerned with the transportation and logistics infrastructure and equipment requirements or with the potential supplies of raw materials for processing.

## Method and Data Sources

The analysis by county and crop reporting district (CRD) was done in a three step process, as follows:

- 1) Develop crop production trends and forecasts to the years 1990 and 2000.
- 2) Develop livestock production trends and forecasts to the years 1990 and 2000.
- 3) Determine consumption and compute marketable surpluses for the years 1990 and 2000.

The forecasts by county were developed from a two-step process. Each county was estimated as a percentage of Minnesota's production using a time series analysis of county percentages of total Minnesota production from 1970 to 1983. Minnesota's market share was estimated in a similar fashion as a percentage of the national total. Minnesota's percentage share projections are found in Appendix A. National production projections were then provided by the North Central Regional Research Committee for

Agricultural Transportation (NC-137). The model on which these national projections were based was provided by Michigan State University. The economic assumptions of the model are found in Appendix G. Projections for the State of Minnesota are found in Appendices B and C. Primary sources of production data were Agricultural Statistics published by the United States Department of Agriculture and Minnesota Agricultural Statistics issued by the Minnesota Agricultural Statistics Service. When data were not available by county from the Minnesota Agricultural Statistics, district and county percentages were estimated from the 1982 Census of Agriculture, volume 1. Feed rations were obtained in interviews with specialists in the Department of Animal Science at the University of Minnesota. Additional ration information was obtained from the Minnesota Farm Management Associations and from the Minnesota Dairy Herd Improvement Association. Definitions of livestock categories and the feeding rations used for northern and southern Minnesota are found in Appendices D, E, and F.

Crop Production Trends and Forecasts to 1990 and 2000 (Tables 1-10)

Production levels forecast for the years 1990 and 2000 for five grains (corn, soybean, wheat, barley, and oats) are presented in Table 1-10. Each crop is reported in two tables. The first table for each grain (Tables 1, 3, 5, 7, 9) reports the average actual production for 1979-1981, and forecasted levels for 1990, and 2000 for the nine CRD's. The next three page table in each group provides county production in thousands of bushels. The columns headed with "Ave. 79-81" are the average production level for each county or CRD from Minnesota Agricultural Statistics for the period 1979 to 1981. The columns headed "1990" and "2000" give the forecasted county or CRD production (and relative market share) for those

years. No adjustment for feed or seed use were made to these projections.

Livestock Production Trends and Forecasts to the Year 1990 and 2000 (Tables 11-26)

Production levels and forecasts for the livestock classes (milk cows, beef cows, cattle placed on feed, other cattle, all cattle, pigs, hens and pulleys of laying age, broilers, and turkeys) are presented on Tables 11-26. The tables are presented in the same format as crops except for "other cattle" and "all cattle" which are only reported by CRD.

Production and Consumption Trends and Forecasts to the Year 1990 & 2000 (Tables 27-34)

Estimates of production and consumption of the three major feedgrains are given in Tables 27-32. The production estimates are from Tables 1-10, and the consumption estimates are based on the livestock projections in Tables 11-26 and the respective rations found in Appendices E and F. Surplus and deficit is the difference between production and consumption for the individual county. No adjustment for seed use was made. Tables 33-34 only provide consumption estimates for 40 percent protein meal equivalent based on the livestock projections and the rations from Appendices E and F.

Symbols used throughout Tables 1-34: "a" designates inadequate data available  
"b" designates production not projected

## APPENDIX D

## Livestock Class Definitions

Definitions

Milk cows = cows and heifers that have calved used for milk.

Beef cows = cows and heifers that have calved used for beef.

Cattle on feed = cattle placed on feed Oct.-Dec. previous year, plus Jan.-March, April-June, and July-Sept. present year.

Other cattle = total cattle - (beef cows + milk cows + cattle on feed, Jan. 1)

Pigs = production equals previous fall pigs saved plus present year spring pigs saved.

Laying hens = average number of layers.

Broilers = commercial broilers.

Turkeys = turkeys: numbers raised.

b) U.S. population growth:

|      |          |
|------|----------|
| 1986 | 1988 +   |
| .91% | .85-.77% |

c) Consumer Price Index (CPI)

|      |      |      |         |
|------|------|------|---------|
| 1985 | 1986 | 1987 | 1988 +  |
| 4.8  | 4.9  | 5.1  | 5.2-6.0 |

d) Real Interest Rates (90 day bankers acceptance minus inflation)

|      |      |      |          |
|------|------|------|----------|
| 1985 | 1986 | 1987 | 1988 +   |
| 6.3% | 6.0% | 5.2% | 4.8-3.0% |

e) Real Growth Rates in Various Economies (Real GNP Growth Rates using standard population projections 1986 +)
