ENERGY ACCOUNTING IN THE FOOD PROCESSING INDUSTRY

By

John A. Barton

and

Thomas J. Lutton ^{1/}

INTRODUCTION

Abrupt changes in the Nation's energy situation may seriously affect performance in the food processing sector of the food system. Short-term energy problems are likely to concern a certain type of fuel or center on a specific region and will, therefore, have varying effects on the different components of the food processing industry. Given the critical nature of the energy input in food processing and the importance of the processing industry, it is essential that Government and business have access to a detailed description of processing energy use. Data on food processing energy use by fuel, industry, and State are presented here as an aid to energy policy formulation.

Food Processing Energy Accounting

The 1975 Annual Survey of Manufacturers (ASM) reports national fuel use data for Standard Industrial Classification (SIC) ^{2/} 20 (food and kindred products), all of the three-digit industries with the exception of coal in two industries, and most of the four-digit SIC industries. State data, however, are subject to disclosure problems at the two- and three-digit levels, and are not reported at the four-digit level ^{3/}. Approximately 15 percent of the State two-digit fuel numbers and 50 percent of the State three-digit numbers are not reported by ASM because of disclosure and other problems.

We believe that sufficient information is available in the 1975 ASM and the 1972 Census of Manufactures to estimate those data not disclosed by the ASM. This paper develops a complete accounting of major fuel use at the two-, three-, and four-digit SIC levels by State. The allocation scheme and methodology employed are based on what are believed to be reasonable assumptions concerning processing energy consumption.

^{1/} The authors are energy economists with the National Economic Analysis Division, Economics, Statistics, and Cooperatives Service, U.S. Department of Agriculture.

^{2/} Standard Industrial Classification (SIC) codes were developed by the Office of Management and Budget as a statistical tool. The code classifies industries as economic units which produce goods or services. In this report, the major classification is Food and Kindred Products (two digits). The three-digit subgroups identify general food industries such as meat or dairy products, while the four-digit subgroups provide a further breakdown of those industries--for example, poultry dressing plants and fluid milk processors.

^{3/} Although industries are required by law to report energy usage, data may be withheld by Census if the reporting of such violates the confidentiality of a firm or firm's data.

Overview of Energy Use in Food Processing

Energy consumption in the food processing industry in 1975 totaled 0.92 quads (quadrillion Btu's). The food processing industry, or SIC 20, accounted for 1.3 percent of total U.S. energy consumption and about 23 percent of the estimated 4 quads of direct energy consumed in the food system. Food processing accounted for some 7.6 percent of total manufacturing fuels and electricity consumption, with the proportions ranging from 6.5 percent for electricity to 10.9 percent for distillate oil (table 1).

Table 1-- Fuels and electricity consumed in the food processing industry, 1975

Item	:Distillate : : oil :	Residual : : oil :	Coal : :	Natural : : gas :	Electricity
	: : ---1,000 barrels---		1,000 : short tons	Billion : cubic feet	Billion : kWh
Fuel consumed, SIC 20:	11,476	13,893	3,893	441	38,299
Fuels consumed, all manufacturing	: 105,296	: 117,407	: 44,623	: 5,807	: 591,695
Fuel consumption in SIC 20 as a percent- age of all manufac- turing	: 10.9	: 7.8	: 7.1	: 7.6	: 6.5
			<u>Percent</u>		

Of the nine three-digit SIC food processing industries, the sugar and confectionery products industry (SIC 206) consumed the most energy--about 17 percent. The bakery products industry (SIC 205) used the smallest amount (around 6 percent) after miscellaneous food and kindred products (SIC 209). With respect to fuel type, natural gas represented the largest share of total energy consumed in each of the nine three-digit industries (table 2). In four of the three-digit industries, natural gas represented over 50 percent of total Btu consumption (table 2).

METHODOLOGY

The overall methodology consists of filling in the undisclosed State two-digit numbers, and then estimating the undisclosed three-digit numbers. Finally, the State three-digit fuel quantities were allocated among the four-digit industries. Tables 3 through 53 provide energy use data for the 50 States and the District of Columbia.

Two-Digit Industry/State Fuel Totals in ASM

Of the 357 State two-digit fuel numbers in ASM, 52 were undisclosed. These numbers were estimated using related census data and additional information which was available. The reporting of the data in the ASM is such that row totals (State-purchased fuels and electricity) and column totals (U.S. consumption of fuels and electricity in SIC 20) could be used to provide an approximation of undisclosed two-digit numbers. The reason these figures may be used only to approximate undisclosed data is that the purchased fuels and electricity (PFE) values, which are in kilowatt-hour

Table 2--Percentage of energy consumption in the food processing industry by three-digit SIC and fuel type, 1975

SIC code	Item	Purchased fuels and electricity	: Distillate: oil	: Residual: oil	: Coal	: Natural: gas	: Elec- tricity	: Other fuels and fuel not specified by type	: Percentage of total energy consumed in food processing
SIC 20	: Food and kindred : products	100	7.3	9.5	9.0	49.8	14.2	10.2	100.0
SIC 201	: Meat products	100	6.6	5.9	4.3	46.7	21.9	14.6	11.6

SIC 203	: Canned and preserved: : fruits and vege- : tables	100	8.4	11.5	2.4	56.1	13.7	7.9	13.7
SIC 204	: Grain mill products	100	5.7	7.9	17.9	47.8	13.5	7.2	15.6
SIC 205	: Bakery products	100	5.6	16.9	.1	53.5	17.6	6.3	5.7
SIC 206	: Sugar and confec- : tionery products	100	5.4	14.0	25.4	47.6	4.4	3.2	16.6
SIC 207	: Fats and oils	100	9.0	8.4	4.2	56.6	11.3	10.5	10.6
SIC 208	: Beverages	100	9.5	9.0	5.8	50.5	15.0	10.2	10.7
SIC 209	: Miscellaneous food : preparations and : kindred products	100	8.6	11.9	.2	43.6	21.6	14.1	5.2

equivalents, include two categories that are not quantifiable--other fuels and fuels not specified by kind.

Additional information included fuel mix in States adjacent to those with disclosure problems. For example, if New York consumes an undisclosed quantity of coal, the relationships between PFE and coal for New York are more likely to resemble similar relationships in New Jersey or Pennsylvania than California, where no coal is consumed, or Louisiana, where natural gas is more heavily relied upon.

This technique is not unreasonable in light of the size and distribution of the undisclosed numbers. Ten States accounted for 52 percent of the undisclosed numbers, while their combined purchased fuels and electricity totals accounted for only 2 percent of the U.S. two-digit total. Disclosure problems tend to be concentrated in States with a relatively small food processing industry where reported numbers could be directly attributed to only a few firms; hence, the potential for substantial errors in allocating fuels is quite limited.

The areas where the greatest room for error exists are in allocating coal in States where its use is regulated, and distillate and residual oil where both fuels are undisclosed. Distillate and residual oil appear to be highly substitutable, and the mix can change fairly easily.

Three-Digit Industry/State Fuel Totals

Undisclosed fuel consumption figures for industries at the three-digit level totaled 1,137, or 50 percent of the 2,295 State three-digit industry fuel numbers. In order to fill in the disclosure gaps, it was necessary to develop a methodology based on reasonable assumptions concerning energy usage which would employ available census data, including the disclosed State three-digit figures.

The procedure allocates the undisclosed portions of State two-digit fuel quantities among State three-digit industries; this method uses national four-digit labor data. ^{4/} Specifically, these data were used to generate State three-digit fuel shares on the basis of an energy intensiveness measure (the national fuel-labor ratio), and a measure of the relative level of industry fuel requirements (the State labor quantity). Each State was considered separately as was each of the seven fuels.

The calculations consisted of three basic steps. First, national ratios of fuel input per unit of labor input were calculated for each of the 47 four-digit industries. Second, State four-digit labor quantities were multiplied by the national four-digit fuel-labor ratios with the resulting products summed for each unreported three-digit industry. A preliminary fuel estimate thus was obtained for each unreported three-digit industry. Finally, to determine three-digit shares of undisclosed two-digit fuel consumption, each of the preliminary fuel estimates was divided by the sum of these estimates. By construction, therefore, the sum of State three-digit fuel estimates is equal to undisclosed State two-digit fuel consumption.

Preliminary fuel estimates for unreported three-digit industries were calculated for each fuel and each State as follows:

^{4/} While there are no disclosure problems as such with the data on numbers of employees, ranges for numbers rather than the actual figures are often reported. In most cases, however, this is done only where numbers are small and the midpoint of the range may be taken as a reasonable approximation. There also exist State, regional, and U.S. three-digit industry totals and four-digit national totals which tend to minimize the potential for error in assigning numbers within the ranges.

$$(1) \quad \bar{F}_i = \sum_{j=1}^J R_j x_j,$$

where: R_j = The national ratio of fuel to labor in four-digit industry j ,

x_j = State labor in four-digit industry j ,

\bar{F}_i = The sum of products across four-digit industries, which may be interpreted as the preliminary estimate of undisclosed fuel consumption in three-digit industry i , and

$j = 1, 2, \dots, J$, representing the four-digit industries classified within three-digit industry i .

Undisclosed portions of State two-digit fuel quantities were then allocated among unreported three-digit industries, using shares generated from preliminary estimates.

$$(2) \quad F_i^\Lambda = \frac{\bar{F}_i}{\sum \bar{F}_i} \quad (\text{FT-FD})$$

where: F_i^Λ = Estimate of consumption of a fuel in three-digit industry i ,

$\sum \bar{F}_i$ = The sum of preliminary fuel estimates for unreported three-digit industries,

FT = The reported two-digit fuel total, and

FD = The sum of the reported three-digit industry fuel quantities.

The basic assumption here is that the relationships among four-digit fuel-labor ratios within a given three-digit industry are the same at both the national and State levels. It is, therefore, not necessary that actual national ratios equal State ratios.

Differences in absolute levels of industrial fuel consumption among States are allowed for in the sharing scheme. To the extent that the above assumption is valid, calculated fuel shares will approximate actual shares.

Four-Digit Industry/State Fuel Totals

The procedure used in developing fuel consumption numbers for four-digit industries was similar to that used in filling in the undisclosed numbers for three-digit industries. The four-digit fuel shares are simply the national four-digit fuel-labor ratios, and there are no disclosed numbers to take into account. The four-digit estimates, however, are subject to a larger error factor than estimates at the two- and three-digit levels and should only serve as indicators of fuel consumption.
