16. Abstract (Limit: 200 words)

The Ivory Coast, a West African coffee and cocoa exporter, has import market potential based upon one of the highest rates of real economic growth on the African continent. Because of this income growth, as well as a higher than average population growth rate and increasing urbanization, imported agricultural commodities have risen to meet the nation's growing food needs. In 1983, Ivorians spent $310 million for agricultural imports, up from $133 million in 1973. France now dominates agricultural trade. However, the United States can expand its sales, which since 1970 have represented 2-7 percent of Ivory Coast's total agricultural imports, if it adopts innovative marketing approaches such as labeling in French and packaging in metric quantities. Premixed feed grain products, tobacco, and preserved milk have the greatest prospects for U.S. export growth in the next 5 years.

Acknowledgments

Many people contributed to this report's final product. Margaret Missiaen, as an ERS country analyst for the Ivory Coast, answered questions and evaluated the contents of this report. Stephen Haykin, David Skully, and Shahla Shapouri each assisted in the regression analysis and projections. Cheryl Christensen, George Gardner, and Stephen Haykin provided constructive criticism of the report. Arthur Dommen supervised the report from start to finish.

Preface

Expanding the market for U.S. agricultural exports is a major goal of the U.S. Department of Agriculture (USDA). The Economic Research Service in cooperation with the Foreign Agricultural Service is preparing export profiles for a number of potential markets for U.S. agricultural products. The Economic Research Service is USDA's major source of agricultural and trade information on foreign countries and regions, while the Foreign Agricultural Service has the key role in helping U.S. agriculture further increase exports in world markets.

This report presents information on the prospects for U.S. agricultural exports to the Ivory Coast. The study surveys factors underlying agricultural supply and demand, presents longrun projections of food and agricultural trade, and suggests opportunities for export expansion. This report is intended for officials responsible for export market development programs, the agribusiness community, and the general public. The profile will also help identify information gaps and can serve as a basis for subsequent evaluations of the effects of market extension activities. Similar profiles have been or will be prepared for selected markets in Africa and the Middle East, Asia, and Latin America.

Conversion chart

This report uses metric units throughout:
1 kilogram = 2.2 pounds
1 metric ton = 2,204.62 pounds
1 kilometer = 0.621 mile
449 Communaute Financiere Africaine (CFA) = 1 U.S. dollar (1985 average)
50 CFA = 1 French franc (fixed rate)

Summary

The Ivory Coast is a West African cocoa- and coffee-exporting nation with import market potential based on one of the highest rates of real economic growth on the African continent. Because of this income growth, as well as a higher than average population growth rate and increasing urbanization, imported agricultural commodities have risen to meet the nation's growing food needs. In 1983, Ivorians spent $310 million for agricultural imports, up from $133 million in 1973.

As a former colonizer, France dominates agricultural trade, enjoying many natural advantages over other competitors. However, its market share has decreased since 1970, with intense competition coming from other suppliers. The United States can expand its sales, which since 1970 have represented 2-7 percent of Ivory Coast's total agricultural imports, if it adopts innovative marketing approaches. Some of these measures include labeling processed goods in French, packaging in metric quantities, and working closely with the Ivory Coast Government on import licensing requirements. The brightest prospects for U.S. sales are in the areas of expanded tobacco exports, processed foods, and premixed grains for the growing poultry industry.

Projections presented in this report show that by 1990, rice imports could reach 557,000 tons, and wheat imports 309,000 tons. For some of the higher value items, vegetable imports could reach 52,000 tons; meat imports 15,000 tons, and milk product imports 84,000 tons. The United States as of yet has not broken into these markets, except for rice. American rice, because of its high quality, is considered a preferred item. However, the high dollar priced the U.S. rice out of the market in recent years, but has started to decline. This decline, in addition to the U.S. Food Security Act of 1985 (with a provision leading to an effective reduction in U.S. rice prices on world markets), promises hope for U.S. rice exports.

Despite the fact that the Ivory Coast suffered an economic downturn from 1982 to 1984, it resumed its positive growth in 1985 due to an excellent cocoa harvest and high coffee prices. However, the country's large foreign debt, incurred in the late 1970's with the hopes of exploiting offshore oilfields, will continue to overshadow the economy. Even though the country undertook a structural adjustment program with the International Monetary Fund (IMF), agricultural imports have continued to increase while other import items have slowed.

Thus, if the Ivorian economy remains healthy and cash crop revenues stabilize, agricultural import requirements are projected to rise through 1990.

The Ivory Coast:
An Export Market Profile

Michael A. Trueblood
Nadine R. Horenstein

Introduction

The Ivory Coast, a Sub-Saharan republic in tropical West Africa, has an estimated population of 10.1 million people. Since independence, the country has had one of the most stable and prosperous economies in Sub-Saharan Africa. A mark of its prosperity was a nominal gross domestic product (GDP) in 1985 estimated at $7.0 billion, or $698 per capita. Unlike many of its neighbors, this country has had a vital agricultural sector made up principally of the cash crops coffee, cocoa, timber, and rubber, which has propelled the economy forward. In addition, the discovery and exploitation of offshore oil fields has helped the country meet its energy needs.

Principal food crops grown in the Ivory Coast are rice, corn, yams, cassava, and taro. The country produces other tropical commodities, such as bananas, pineapple, and sugar. Though the Government's national development plan states food self-sufficiency as a goal, many commodities continue to be imported. These imports include basic commodities such as wheat, rice, meats, milk products, and vegetables.

Until 1980, the Ivorian economy experienced steady and rapid growth. Rapid urbanization, along with rising incomes and changing consumer tastes and preferences, spurred the demand for more and different food imports, even as aggregate domestic food production increased. The last few years were marked by economic recession. In spite of this, commercial food imports have been rising.

Objectives of this study are as follows:

- To analyze the trends in food consumption in the Ivory Coast so that agricultural imports may be carefully examined. As a means to that end, macroeconomic background information on the Ivory Coast is furnished.
- To present current Ivorian agricultural policies and production trends.
- To provide an overview of imports along with an analysis of competing suppliers of imported commodities.
- To analyze trends in food importation through use of an econometric modeling technique. The model yields trend projections for selected commodities based on various hypothetical scenarios.
- To identify strategies for expanding U.S. agricultural exports to the Ivory Coast.

The Ivory Coast's Economy: Past and Present

The Ivory Coast, a West Africa nation with a population of 10.1 million people, is located on the Gulf of Guinea between Liberia and Ghana. Agriculture traditionally has played a dominant role in its economy: today more than 85 percent of the population work in agriculture or forestry. Since its independence from France in 1960, it has retained many of its trading ties with France and French remains the official language. This former French colony has a land size of 323,500 square kilometers (124,503 square miles), roughly the size of the State of New Mexico. Its capital is Abidjan, a coastal city with an estimated 2.1 million people in the metropolitan area.

Strategy for Development

The economic malaise of recent years notwithstanding, few countries in Sub-Saharan Africa can claim as impressive a record as the Ivory Coast in terms of political stability and economic growth. Under the leadership of President Felix Houphouet-Boigny, the country has maintained an open economy, welcoming inflows of foreign capital, labor,

and expertise. Recognizing the primacy of agriculture in the economy, the Government of the Ivory Coast (GOIC) chose to focus on exploitation of the country's comparative advantage in the production and export of tropical agricultural products. At the same time, it pursued a strategy of self-sufficiency for certain foodstuffs such as rice, corn, and root crops. The Ivory Coast Government views strong agricultural development as essential to its twin national goals of balancing regional development and slowing rural migration to the cities. Favorable market conditions persisted through 1977 for coffee and cocoa, two of its major export crops, which contributed to the rapid growth rates of the agricultural sector and of overall gross domestic product (GDP).

The Decade of the 1970's

For the purpose of this report, macroeconomic development is divided into two periods: the decade of the 1970's, and the recent period to 1985. High growth rates in real GDP were a mark of the 1970's: growth averaged 5.8 percent (table 1, fig. 1). During this period real per capita GDP increased slightly as well (fig. 2). Foreign exchange reserves peaked at $425 million in 1978 (table 2, fig. 3). Most of these gains reflected the high world prices for cocoa and coffee, principal Ivory Coast export commodities.

The Government modified its development strategy in the late 1970's, investing most of its earnings and exchange reserves from the commodity "boom" into long-term development projects. In addition, the country took out large foreign loans to invest in drilling of newly discovered offshore petroleum fields. These debts were incurred with the hope that they could be easily repaid once oil exportation began.

The Current Situation

The 1980's have brought mixed fortunes to the Ivory Coast, due to many external factors. The early 1980's were particularly harsh. World interest rates rose sharply, and the French franc (to which the Communaute Financiere Africaine [CFA] franc is tied) began depreciating against the U.S. dollar (fig. 4). This latter event increased the cost of servicing the Ivory Coast's dollar-denominated debt. Also, world cocoa and coffee prices had already begun their descent when drought set in in 1982, exacerbating a decline in export earnings (fig. 5).

In addition, the world oil glut placed downward pressure on petroleum prices in 1981, erasing any illusions of becoming a wealthy oil-exporting nation. However, this did not matter, as oil output has disappointed previous expectations, not yet even meeting domestic consumption needs. In 1985, the two producing fields, operating in joint ventures with the Ivorian Government by the Phillips Petroleum Company and Exxon Corporation, respectively, combined to produce only 1 million tons (or 20,000 b/d), as opposed to the domestic consumption level of 1.5 million tons (or 30,000 b/d) (1).[1] Even though oil prices have dropped sharply at present, it is not likely that these offshore ventures will be abandoned, considering the sizable sunk costs involved.

From 1982 to 1984, the Ivory Coast suffered 3 consecutive years of negative real growth in the 4- to 5-percent range (table 1, fig. 1). The petroleum sector (though disappointing) and other new industrial sectors stimulated the economy in these years, but were not enough to offset the declines in the agricultural sector. In 1985, with improved world conditions affecting Ivory Coast's agricultural sector, the country rebounded to a positive 4-percent growth rate, according to preliminary estimates.

The most serious economic problems confronting the Ivory Coast have continued to be its foreign debt and balance of payments deficits. Though the Government's estimated $7 billion total outstanding debt is small compared with some Latin American countries, it is one of the largest external debts on the African continent (fig. 6). Since 1983, the Ivory Coast has nearly every year rescheduled its medium- and long-term debt with its official and private creditors, the so-called "London" and "Paris" Clubs (1, 5). This has been due to disappointing oil output and the fact that exchange reserves have been depleted. Though the Ivory Coast's economic situation improved in 1985, these large debts will likely overshadow the economy over the next few years.

The balance of payments has been equally troubling for the Ivory Coast in recent years. Since 1981, the Ivory Coast has negotiated relief programs with the International Monetary Fund (IMF), which in turn has called for structural adjustments in the Ivory Coast (table 3) (2, 5). The Ivory Coast has historically enjoyed a surplus in its balance of trade, but has suffered current account deficits because of large net outflows of remittances and services, mainly due to a French expatriate population working for the Government. In 1985, the country finally achieved a positive current account balance, mostly due to

boosted export earnings and a continued contraction of imports.

There were, of course, conditions attached to IMF relief. The structural adjustments involved various measures. Among these measures were cutbacks in public spending and attempts at increasing revenue by 20 percent. Most of the revenue increase was to come from anticipated profits from the nation's agricultural producer price stabilization board, Caisse de Stabilisation et de Soutien des Prix des Productions Agricoles (CSSPPA), in light of increased world prices for key export crops. Subsidies for retail items were eliminated and some value-added taxes were introduced. Short-term loans were prohibited, salaries remained frozen until 1984, and major cuts were made in capital investment spending. In addition, Government enterprises (parastatals) were turned over to the private sector (3).

The Agricultural Sector

The Ivory Coast possesses diverse natural resources and a climate conducive to high agricultural production. Agriculture, which includes the forestry industry, remains the key economic sector, generating one-fourth of GDP and over three-fourths of the nation's total export earnings. The Government lends

strong support to the agricultural sector, and in particular, to the numerous small holders through its programs of producer price subsidies, input subsidies, and agricultural extension services. Before 1977, agricultural development focused mainly on the development of individual crops. In recent years, however, the Government has shifted some of its emphases and broadened its approach to include the development of regions rather than specific commodities. Key elements in this approach include diversifying cash crop farming, encouraging food crop production, and developing and expanding facilities for agricultural processing.

The National Development Plan

Government planning underpins actions to strengthen the nation's agricultural base. The 1981-85 Five-Year

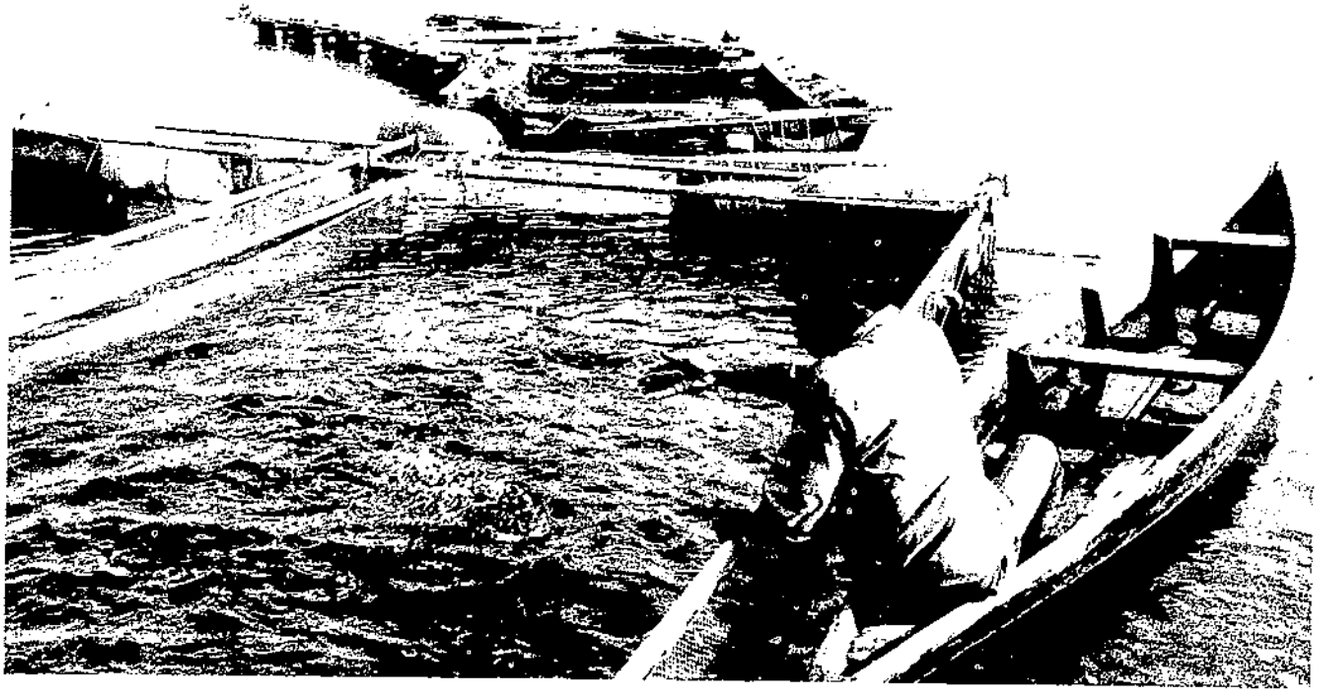
National Development Plan, which was devised to promote a healthier economy, places priority on the modernization of the agricultural sector and sets ambitious production targets for all crops. As part of its strategy to attain food self-sufficiency, the Government is now offering 30,000 hectares of free land clearance to farmers provided they grow certain food crops. In addition, the Banque Nationale pour le Developpement Agricole (BNDA) has set up both subsidy and guarantee funds to encourage young people to stay in, or return to, farming.

In the 1981-85 plan, close to 15 percent of total public investment was spent on agriculture (6). Of a total 273 billion CFA francs, 64 percent was directed to export crops while 19.4 percent was channeled to food crops. Actual allocations to food crops are somewhat higher because of sizable investments in integrated development projects. The Government devoted particular attention to rice production because of the increasing concern over rice imports. As a result, investment in irrigated rice production amounted to 16 billion CFA francs. Additional investments target rainfed rice. Total paddy (or unmilled rice) was projected to increase at an average annual rate of 7.5 percent between 1980 and 1985 and 11.3 percent between 1985 and 1990, compared with an average annual increase of 6.4 percent between 1970 and 1980. For the 1980 to 1984 period, actual paddy production increased at 6.8 percent per year.

According to the plan forecast, by 1990 rice will become an even more important part of the Ivorian diet, representing 33.5 percent of the caloric intake, compared with 25.1 percent in 1980. Given these trends, the plan projects rice imports to rise to as high as 500,000 tons by 1990 (in 1983, imports peaked at 382,000 tons). Consumption of pulses, roots, and tubers is expected to decline, representing 39.4 percent of caloric intake in 1990 against 51.3 percent in 1980. To narrow the gap between domestic supply and demand, the plan proposes to offer incentives to both producers and consumers of traditional foodstuffs, to use all production factors more efficiently, and to reduce food losses associated with all aspects of the food chain.

The plan also envisages important increases in meat, poultry, and fish production. In 1980, under 20 percent of beef consumption was met by domestic output. By promoting industrial ranching and establishing several fattening units, the Government projects that domestic beef production will reach 40 percent of consumption requirements by 1990. The country is basically self-sufficient in pig and poultry production. To increase the proportion of domestically produced fish in relation to total fish consump-



Fresh water fish, a leading source of protein for Ivorians, are "farmed" in an artificial lake near the city of Bouake.

tion, action has been taken to cultivate or "farm" fish in rivers and lagoons.

Crop Trends and Policies

Overall, Ivory Coast's agricultural sector has performed well relative to the rest of Sub-Saharan Africa (table 4). While Sub-Saharan Africa has received much publicity for its recent famine and declining per capita food production, the Ivory Coast has run counter to this trend. Food production per capita has actually increased consistently over time in the Ivory Coast; agricultural production (which includes nonfood crops) has generally increased as well, albeit with more fluctuation (12).

The Ivory Coast leads the world in the production and export of cocoa, and ranks third as a producer and exporter of coffee (table 5) (10, 11). Favorable growing conditions and buoyant world prices for these commodities through 1977 had provided much of the impetus for output expansion and allowed the CSSPPA, the nation's agricultural producer price stabilization board, to use export profits to finance a special investment and equipment budget as well as to subsidize inputs to farmers.

Since 1978, world prices for both cocoa and coffee started to slacken (fig. 5). In 1980, the International Cocoa Organization (ICCO) was formed by major cocoa-producing nations in an effort to control world supplies and prices. Dissatisfied with the pricing range and buffer stock policies desired by other producing nations, the Ivory Coast did not join this cartel. The cartel agreement negotiated in 1980 expired in July 1986. The Ivory Coast announced in March 1986 that it would again not participate in the cartel, ending speculation by other producing and consuming countries and putting downward pressure on world prices. This price fall was later eased when the Ivory Coast announced it would reconsider its position (2). Current ICCO negotiations will influence cocoa prices for the next few years.

Though cocoa prices fell more than 50 percent between 1977 and 1982, they did rebound slightly in 1983 and 1984. This increase was due to reduced world supplies brought on by drought, which led to reduced harvests in the Ivory Coast as well as neighboring countries Ghana and Nigeria (10, 12). However, the Ivory Coast has produced abundant crops the past two growing seasons (1984/85 and 1985/86), which have been of exceptional quality. These factors have boosted the Ivory Coast's export earnings.

The Ivory Coast joined the International Coffee Organization (ICO), a cartel that was formed in 1963, and continues to be an active member. The Ivory Coast produces the *robusta* type of coffee bean. This bean is used primarily for producing instant coffees. *Robusta* coffee is considered lower in quality and its price is lower, but follows similar price patterns of higher quality *arabica* coffee.

World coffee prices, like cocoa prices, began to drop in 1978. The drop continued until the 1985/86 season when prices rebounded as a result of coffee crop shortages. The shortages were brought on by drought in Brazil, the world's largest producer and exporter. Prices have risen so high during the 1985/86 season that ICO cartel quotas have been suspended, thus allowing each country to export as much coffee as possible. This misfortune to Brazil has indirectly benefited the Ivory Coast's export earnings. The coffee price upturn, coupled with recent strong cocoa exports, has meant that the Ivory Coast is currently enjoying an unusually large balance of trade surplus.

The Ivory Coast produces a host of other important crops for export and domestic consumption (table 5). They include fresh and processed pineapples, sugar, bananas, and cotton. Timber and rubber are also key foreign exchange earners.

Rice is the principal grain produced and consumed in the Ivory Coast. The grain has become a staple for much of the urban population and is also popular in rural areas due to its ease of preparation and storage. The composition of rural and urban diets is shown in table 6. Although rice production has risen steadily, it has not increased rapidly enough to keep pace with accelerating per capita consumption (table 7). The result is that the Ivory Coast meets more than half of its current rice consumption through imports.

Because rice figures so prominently in the Ivorian diet and has become increasingly necessary to import, the Government has played an active role in price and trade policy. During the 1973-74 period, when world rice prices more than doubled, domestic substitution for imports became a priority (fig. 7). Consumer and producer prices were increased significantly, and as domestic production increased, imports dropped to virtually nil in 1975 and 1976. The net result was that per capita consumption fell.

Government intervention exacted a toll, however. The high producer prices had the effect of creating large Government-held stocks, while the high retail prices limited demand. To cut down on storage costs, the Government lowered the retail price but

maintained the producer price, thereby subsidizing domestic production. In 1981, the Government tried to reduce its subsidy payments by cutting producer prices, but when output dropped, previous prices were quickly reinstated. Since 1977, with the dissolution of the state rice marketing agency, Societe pour le Developpement de la Riziculture (SODERIZ), effective marketing of domestic rice production has broken down, and imports have been increasingly needed to supply urban markets (*13*).

Despite the subsidy's drain on the budget, the Government continues to encourage rice production through inducements. For example, it increased producer prices in 1982/83, and since then farmers who plant more than half a hectare receive free

rice seed and fertilizer. The retail price of 160 CFA francs per kilogram (kg) compares favorably with that of other commodities. A number of rice production projects have been established, mainly in the northern regions. To date, they have not produced competitively priced rice relative to international import prices. The Government, however, justifies these investments as a means of achieving a better regional distribution of income and improving the nation's trade balance.

Wheat is not grown in the Ivory Coast, but bread is a popular and inexpensive food item in both urban and rural areas. Thus, the growing demand for wheat has caused wheat imports to climb in recent years (tables 8 and 9). The Government sets the retail prices of wheat flour and bread. Price fixing has become a politically sensitive issue, since profit margins for bakers have been squeezed in recent years due to rising costs. Only lately have bakers been permitted to reduce the weight of a loaf of bread without lowering the price (14).

Corn is becoming an increasingly important grain crop in the Ivory Coast; its production has nearly tripled since 1970. Most is used for human consumption, with some used as feed for the country's growing poultry industry. The Ivory Coast grows millet and sorghum in modest quantities.

The production of roots and tubers plays an important part in the Ivorian diet. Yam output exceeds the production of any other agricultural commodity, with production estimated at a record-high 2.6 million tons in 1984. Other important crops are cassava (or manioc), with 1.1 million tons produced in 1984, and taro (or cocoyams) with 230,000 tons grown in 1984.

Production of Livestock, Poultry, and Fish

During the 1970's, consumers increased their demand for red meat. Beef's share of red meat consumption stands roughly at 75 percent, while goat and mutton's share is 20 percent, and pork 5 percent. One study showed that while the kinds of red meat consumed remained constant during the 1970's, the supply sources changed (8). Domestic production currently accounts for roughly one-fourth of red meat supply. During the mid-1970's, however, a dramatic shift took place in which frozen beef imports from non-African countries began replacing live animal imports from neighboring nations. This shift was a response to the Sahelian drought, in which livestock producers minimized losses by slaughtering their herds in the short run, but which created a longer term supply shortage in the late 1970's. In the early 1980's, Ivorians increased their meat supplies from neighboring countries while also rebuilding their domestic herds. Drought in 1983-84 once again led to heavy slaughtering. Consequently, meat supplies

can be expected to be much tighter for the next several years.

Estimates of meat self-sufficiency are difficult to derive. However, indicators point to domestic beef production accounting for about 20 percent of consumption, pig production accounting for over 90 percent, and goat and mutton production accounting for about 35 percent. Cattle production consists of two varieties: zebus, or humped cattle (Bos Indicus), and taurins, or humpless cattle (Bos Taurus). Both species are raised mainly in the northern savannah, with the zebus very susceptible to disease. Most of the pig production takes place in the traditional sector, although some commercial pig producers are using imported hybrid breeding stock, high-quality feeds, and modern techniques. Traditional methods still exist in the raising of most goats and sheep.

In the Ivory Coast, poultry is raised in villages as well as on commercial poultry farms. Poultry meat production reached 35,000 metric tons in 1984 and is estimated to cover close to 90 percent of consumption.

Fish is a leading source of animal protein in the Ivorian diet, with per capita average annual consumption estimated at 25 kg. Modern fishing vessels that operate in the Atlantic Ocean comprise the commercial salt water fishing industry of this West African state. Fishing takes place in coastal waters as well as in lagoons and rivers. Recently, however, catch levels have stagnated in coastal and inland waters because of intense exploitation and pollution. Plans are in the works to complete an artificial lake and fish ponds once construction of various hydroelectric projects is complete. The Ivory Coast

The number of cattle farms is growing in the Ivory Coast, but demand for beef outstrips production. By 1990, the country hopes to meet 40 percent of its beef consumption needs.

exports a substantial amount of tuna, offsetting the foreign exchange spent on imported fish.

Marketing, Distribution, and Processing

The private sector controls most of the food importation and distribution in the Ivory Coast. The exception is with rice, whose importation is controlled by the Ministry of Commerce. Although numerous Ivorian importers operate in the Ivory Coast, a few large French-owned or French-controlled trading companies effectively dominate the food import and distribution sector.

The CSSPPA, under the guidance of the Ministry of Agriculture, fixes the prices paid to farmers for most agricultural products, supervises their domestic distribution, and licenses their export. The prices of those commodities considered politically sensitive, such as rice, bread, and sugar, are regulated by the Ministry of Commerce through the Caisse de Perequation (CP).

With producer prices for paddy (threshed, unmilled rice) in 1984/85 set at 80 CFA francs/kg at the farmgate and 95 CFA francs/kg at the mill, the value of the processed output barely covers the costs of producing and processing the grain. The most recent data available show that the Government has had to pay a subsidy of 53 CFA francs/kg to make up the difference between the cost of purchasing and processing the paddy, estimated at 171 CFA francs/kg, and the sale price to wholesalers, officially established at 118 CFA francs/kg. In 1981/82, it was estimated that the total cost of the subsidy amounted to $8.0 million, possibly reaching $10.4 and $11.0 million in the following two seasons. Subsidies such as these are usually offset by the profit the Government, through the CP, makes on importing low-cost Asian rice. Until March 1983, rice imports were tendered for internationally, that is, bid openly on the international commodity markets. Since then, the CP negotiates directly with foreign governments to procure bulk shipments of rice.

The Government is highly conscious of the need both to assure adequate supplies of rice to its populace and to offer the proper incentives to domestic rice producers. The quantity and timing of rice imports are regulated through licensing procedures established by the Direction du Commerce Interieur. Licensed dealers buy imported rice from

the CP or domestic rice from the rice mills. They are required to have at least 1 month's rice supply in storage and must carry both imported and domestic rice.

Because the majority of the available domestically produced paddy is hand milled and either marketed locally or consumed at home, only 20 to 30 percent is delivered to the rice mills. As part of its structural adjustment programs with the IMF, the Government has turned over its rice mills and warehouses to the private trade, in the hope that such actions will spur domestic production and improve the efficiency of rice processing and marketing (*3*). Six private firms are now responsible for rice milling, although they continue to come under Government regulation.

Bread prices are also regulated by the CP. Widely consumed across the country but particularly in urban areas, bread remains subsidized. Almost all the wheat that goes into bread production is purchased by the French-controlled Grands Moulins d'Abidjan, the country's major flour mill which so far has been capable of meeting the country's needs. A second flour mill with a 40,000-ton capacity began operations in 1982, but thus far has been used little. Ivorians are the primary investors in this mill, but the U.S.-based Dreyfuss Company has also had financial involvement.

Though staple foods such as fresh fruits and vegetables, meats, fish, rice, and bread are retailed mainly in small local markets, processed foods, which are largely imported, are sold in larger grocery stores or supermarkets. Most of the major trading companies are French owned or controlled. These companies are distribution subsidiaries for French food corporations or owners of supermarket chains. The largest chain, Chaine Avion, which is owned by the French trading company Societe Commerciale de l'Ouest Africain (SCOA), controls more than 200 stores throughout the country. One advantage of this trading structure is that import items receive concessions when declared at customs. Overall, French food exports to the Ivory Coast have the advantage of less costly and more frequent shipping. And because of French labeling on food products and postcolonial trading ties, French items receive high consumer recognition.

Until 1980, a public agency was charged with procuring, wholesaling, and retailing both fresh food and nonperishable items through a chain of outlets. The agency procured food items from domestic and import sources. In 1980, however, the agency's functions were formally abolished with the hope that the private sector could operate more economically. Since a private distribution system comprising numerous small traders already existed, marketing functions continued smoothly once the agency dissolved.

Trends in Food Imports

From 1970-83, the value of Ivory Coast's food imports has increased more than fivefold.[2] This amounts to an increase from $53 million to $287 million (table 8). Although the nation has experienced a slowdown in the growth of total imports in recent years due to a general economic downturn, many categories of food imports have been unaffected and, in fact, have shown significant increases. Rice imports, particularly, have shot up since 1977.

Factors Affecting Food Import Demand

Two important forces fueling food import demand are population growth in general, and urbanization in particular. In 1985, total population was estimated at 10.1 million. While average annual population growth from 1970 to 1980 is estimated at 3.9 percent, urban growth rates during this period climbed as high as 8 percent. This urban migration trend is a direct result of the movement of rural Ivorians to the cities and the influx of foreigners from neighboring countries to the Ivory Coast's urban centers. Since the analysis in this report is based on data representing national averages, it likely masks the effect on demand of rapidly changing consumer tastes in urban centers.

As Ivorian incomes have risen, the demand for more and different kinds of food has increased (table 9). In the Ivory Coast, imports serve to either supplement domestic availability of foodstuffs (such as rice and meats) or to satisfy the demand for foods that are not produced domestically (such as wheat, dairy products, and certain kinds of processed foods).

As stated earlier, per capita food production has consistently increased in the Ivory Coast since 1970. Although rice output has moved upward significantly, the domestic production's share of total consumption has been dwindling since 1977, satisfying only about 41 percent of demand in 1984. Increased domestic production of corn, particularly since

[2]Nineteen eighty-three is the latest year for which there is complete data.

1980, has already scaled back the need for imports. As domestic beef production grows, imports' share of consumption should decrease, though still increasing in absolute terms.

According to an annual import program, imports to the Ivory Coast are subject to licensing that establishes a quota for bilateral commercial agreements. Import licenses or certificates are required for most products. These are issued and regulated by the Ministry of Economy and Finance. Rice is one of the few foodstuffs whose availability is closely monitored because of the Government's concern for ensuring a steady supply.

Market Shares

France remains the most important supplier of Ivory Coast's food imports, although other countries are beginning to compete. In 1970, France's market share stood at 40 percent, but by 1983 it had declined to 33 percent, indicating the extent to which suppliers to the Ivory Coast have diversified (table 10, fig. 8).

As a former colonizer of the Ivory Coast, France maintains many advantages over other suppliers. France and the Ivory Coast share a common language, and there still exists a French expatriate population that provides technical assistance to Ivorian Government operations. The Ivory Coast is a member of the French franc zone (CFA), which encourages trade relations with France in the face of currency fluctuations against the French franc. In addition, many of the large trading companies and businesses are either French owned or controlled and employ French nationals. In agricultural trade, the French have a virtual monopoly on wheat exports, averaging 95 percent of the market since 1970. France has also been a significant exporter of beef, fish, milk products, and vegetables.

The U.S. share of the Ivory Coast's agricultural imports has fluctuated, reaching a high of 7.5 percent in 1978, which represented $20.2 million. Since 1978, the value of U.S. exports has generally declined. In 1983, the Ivory Coast imported $8.5 million worth of U.S. agricultural commodities, or only 2.7 percent of its total agricultural imports. Taking into account that total agricultural goods cannot be aggregated on a volume basis and considering the exchange rate depreciation (CFA to the dollar) in recent years, the decline in value of U.S. exports may be deceptive.

Most of the gains for U.S. agricultural exports to the Ivory Coast have been in bulk commodities such as rice, corn, and tobacco. But in recent years, these gains have dwindled because of the dollar's high value compared with the French franc, to which the CFA franc is tied. This fact has made U.S. goods expensive for the Ivory Coast. In the case of rice, the Ivorian Government seems to have adopted a strategy of importing inexpensive, low-quality rice to insure political stability in urban areas while it reduced other import items as part of its attempt to bring its balance of payments problems under control. This action hurt U.S. rice sales in recent years, since U.S. rice exports are more expensive but of higher quality.

Source: (9).

In the area of nonbulk items, where packaging and labeling are required, the United States has not fared too well. Although the Ivory Coast can import products with English labeling, Ivorian consumers find products with French labeling and instructions much more appealing. For U.S. nonbulk items to compete successfully, labeling needs to be a consideration. In addition, selling products in metric units is likely to be more amenable to Ivorian consumers.

Historically, The Netherlands has been a stable trade partner for the Ivory Coast, supplying, on average, 9.4 percent of agricultural imports annually since 1970. Milk products and fresh vegetables make up most of the trade. As a bloc, the other European Community (EC) countries (excluding France and The Netherlands) have been a consistent supplier since 1970, averaging 11.6 percent of imports.

An emerging trading bloc, made up of the Asian countries of Burma, Thailand, Pakistan, and the People's Republic of China (PRC), has captured 21.4 percent of imports since 1979. The prominence of the Asian trade group is mostly due to stepped-up rice exports.

Ivory Coast also trades with its African neighbors. Much of the country's livestock comes from Mali. Senegal is an important supplier of fresh and frozen fish, and it is likely that unofficial trade in many other commodities takes place across national borders.

Food Import Profile

The major food items imported by the Ivory Coast are wheat, rice, meat, fish, milk, and vegetables. Together these commodities accounted for about 94 percent of total food imports in 1983.[3] All have shown rapid growth over the 14 years from 1970 to 1983, although shifts have taken place within commodity groups. In 1983, the value of wheat and rice together accounted for about 46 percent of the total food imports, compared with about 28 percent in 1970. Processed vegetable imports have now become more important than fresh vegetables, and canned or frozen meat imports have supplanted live animal imports. These trends reflect, in part, changing consumer tastes and preferences for foods that are easier and less time consuming to prepare.

Rice. During the mid-1970's, the Government attempted to use rice policy as a tool for achieving better regional distribution of income and improving the nation's trade balance. Consequently, rice imports fluctuated sharply, reflecting the Government's changing emphasis on rice self-sufficiency. Despite the Government's continued goal of self-sufficiency, consumption clearly outstrips production, forcing the nation to increase imports each year. Since 1977, the quantity of rice imports has been on a steady upward climb, peaking at 382,000 tons in 1983, with a value of $94 million (table 11). Preliminary estimates for 1984 show imports at 320,000 tons.

The United States has lost much of its market share to Asian suppliers who sell lower quality rice, containing a higher percentage of broken grains, which carries a lower price tag. The Ivorian Government made this switch to keep rice supplies plentiful at low cost, while it undertook other structural adjustment programs with the IMF. The high U.S. dollar relative to the French franc (and CFA) did not help rice exported from the United States, whose prices are generally higher than other suppliers. The U.S. market share of Ivory Coast's rice imports dropped from about 38 percent in 1978 to 8 percent in 1982. It then fell again to less than 1 percent in 1983 and 1984.

As evidence clearly shows, Asian countries have made great strides in increasing their shares of the Ivorian rice market because of their competitive pricing. In 1970, virtually no rice was of Asian origin. By 1979, Pakistan, the PRC, Thailand, and Burma were exporting large amounts of rice. Between 1979 and 1984, these four countries supplied, on average, 77 percent of Ivorian rice imports.

Wheat. Up until 1975, the quantities of wheat imported by the Ivory Coast fluctuated significantly. However, since then wheat imports have been on an upward path, with tonnage reaching 206,000 tons in 1984 (table 12). France is the dominant supplier, in some years capturing up to 99 percent of the market. Wheat from France is purchased by the French-controlled mill Grands Moulins d'Abidjan. Smaller quantities are purchased by the company's newer mill in San Pedro. Most wheat flour and bran are marketed and consumed locally, although moderate quantities of bran are reexported to France as feed. Small quantities of wheat flour are

[3]Total food imports include the following commodities or commodity groups: live animals, meats and preparations, dairy products and eggs, cereals and preparations, fruits and vegetables, coffee, tea and spices, miscellaneous food preparations, beverages, oil seeds, nuts, kernels, and animal and vegetable oils. For more information, consult table 8 of the text and item 9 of the References.

sold to neighboring countries. In the Ivory Coast, retail bread prices are subsidized, resulting in widespread consumption even in rural areas.

Corn. Corn has been imported both to satisfy domestic consumption demands and to serve as feed for the country's burgeoning poultry industry. Though the amount of imported corn is very small relative to rice and wheat, the United States has been one of the leading suppliers, exporting over 17,000 tons in 1981 (table 13). South Africa and Thailand have exported significant quantities in certain years as well. Overall, imports peaked in 1981 with 24,000 tons and have fallen below 6,000 tons since 1982. This fall is most likely due to the large increases in domestic production (table 4).

Meats. The Ivory Coast has experienced rapid growth in imports of fresh and frozen beef and of canned meat (tables 14 and 15). At an estimated average per capita consumption of 12 kg/year, however, meat consumption is still low. In the early 1970's, little beef was imported. However, beginning in 1975, imports rose in response to the Sahelian drought, peaking at $21 million in 1979 and maintaining an $11-19-million range since then. The Government is actively pursuing a domestic cattle production program, but consumer demand for beef continues to outpace supply. Even with a projected tripling of production by 1990, domestic beef is expected to account for only 40 percent of consumption. The two major beef suppliers are Argentina and France.

Source: (9).

Fish. Fish is the leading source of animal protein in the Ivorian diet. Average annual consumption is estimated at 25 kg per capita and is expected to increase. Domestic production meets less than 50 percent of total consumption demands, leading to the importation of more than 121,000 tons of fresh and frozen fish in 1984. The value of these imports has increased more than thirtyfold since 1970, reaching $59 million in 1984 (table 16). The U.S.S.R., France, and Senegal rank as the major suppliers.

Milk Products. There is little commercial dairy production in the Ivory Coast. However, consumer demand for milk products has risen since 1970. Most imports consist of evaporated or condensed milk which can be stored for lengthy periods without refrigeration. Some 48,000 tons of milk valued at nearly $43 million were imported in 1984, up from 16,000 tons valued at $6.5 million in 1970 (table 17). Subsidized imports from The Netherlands and France account for most. However, in recent years West Germany has emerged as a significant supplier.

Vegetables. Although the Ivory Coast produces a variety of vegetables, increased demand for more or different kinds of vegetables has led to imports of both fresh and prepared vegetables. Together, imports of these two commodity groups were valued at over $16 million in 1983, nearly quadrupling the dollar amounts of imports of 1970 (tables 18 and 19). Fresh vegetable imports consist mainly of potatoes from France and onions from The Netherlands. Tomato paste imports account for a large proportion of the prepared vegetable imports. With annual domestic consumption requirements of tomato paste estimated at 60,000 tons and domestic production averaging only 6,000 tons, it is likely that this commodity will continue to rank high on the list of vegetable imports.

Projected Import Demand

This report analyzes Ivory Coast's demand for imports of five major commodities or commodity groups: rice, wheat, milk products, meats, and vegetables, which together compose the major proportion of total food imports.[4] In the analyses that follow, the authors present findings derived from import demand equations for these five types of commodities.[5] Projections through 1995, based upon these equations, are presented in tables 20 and 21 (see page 28).

Overview

The kind of model chosen for these equations is predictive rather than descriptive. That is, more emphasis is placed upon providing basic trend analysis than upon examining historical interrelationships among variables. The explanatory variables picked to project import demand include population, per capita income, and import prices. Population growth, currently estimated at 4 percent with net immigration, is considered to be the driving force behind the projections.

[4]Although fish imports are a significant proportion of food imports, available data were too limited for an econometric analysis. Analysis of corn imports was also deleted, since imports have fluctuated erratically and are small quantities relative to production (tables 5 and 13).
[5]See Appendix 1 for the results of the econometric equations.

Domestic production is omitted from the equations. In some cases, domestic production of such commodities as wheat and milk products is negligible or uncompetitive, making imports the primary source of consumption. In other cases, imports of such commodities as meat and vegetables fulfill a supplemental role to domestic production. For rice, production was initially included in the equation, but was later excluded after showing very high correlation with population growth.

Overall, the relationships between variables in the model interact generally as expected: imports are positively related to population growth and per capita income, but negatively related to import prices. This means that as population and per capita income increase, the demand for food imports increases; and as import prices increase, demand declines. Note that the elasticities presented are import elasticities and not consumption elasticities (which tend to be lower).

For price elasticities, milk and vegetables are inelastic. Put simply, for every 1-percent change in price that takes place, there is less than a 1-percent change in imports. Wheat, rice, and meats are price elastic where the opposite holds true, showing greater sensitivity.

In the case of per capita income, wheat, milk, and vegetables are inelastic, meaning that imports are less sensitive to changes in income. Meats are elastic, implying greater sensitivity to income changes. Given the complexities of the rice equation, this variable was dropped.

For all the commodities, imports are very responsive to the population growth rate. Given the strength of

this variable in the equations, this is a very important factor in the projections.

The authors make four sets of projections for each commodity, with a different set of assumptions underlying each projection. In the first projection, or the base run, population and per capita income are forecast at trend growth rates while prices are held constant at the 1982-84 average level.

The second and third sets of projections use the same basic assumptions but with a slightly different twist: prices are anticipated to rise and decline by 10 percent in real terms by 1995, respectively.

The fourth set of projections assumes that prices will hold constant at the 1982-84 level, but that the current population growth rate of 4 percent will gradually slow to 3 percent by 1995.[6] This last set of trend projections thus examines the effects of population on import demand.

Projected Agricultural Import Demand by Commodity

Five major commodity or commodity groups that figure prominently in the Ivory Coast's import demands are looked at individually. The commodity-by-commodity analysis presents possible import scenarios based on statistical modeling techniques.

[6]The population growth rate of 4 percent represents not only the net birth rate, but also migration into the Ivory Coast by foreigners. Human reproduction exceeds 3 percent in only a few countries.

Rice. The rice model shows imports to be sensitive to changes in population and highly sensitive to import prices. Per capita income has been eliminated from the equation. Production, which was initially part of the rice equation, was dropped when it was found to correlate highly with population. Though production was not used as a forecast variable, an independent projection of trends was made in order to calculate both total and per capita consumption for the scenarios that follow.[7]

According to the base run projection, imports would rise to 557,000 tons by 1990, then climb to 905,000 tons by 1995. With milled rice production reaching 345,000 tons by 1990 and topping 444,000 tons by 1995, total consumption would rise to 902,000 tons by the year 1990 and edge up to 1.3 million tons by 1995. Imports would make up 62 and 67 percent of consumption, respectively. For the period 1982 to 1984, imports averaged 59 percent of consumption, up from 38 percent for the prior period of 1970 to 1972. Per capita consumption would rise to 73 kg by 1990 and to 90 kg in 1995. Presently, the per capita consumption level in the capital city of Abidjan, the largest urban area, is estimated at around 100 kg.

In the second projection scenario, which features a scenario depicting lower prices, imports would accelerate and per capita consumption would rise to very high levels. For example, imports would reach 640,000 tons by 1990, then peak at 1.17 million tons by 1995, while per capita consumption would increase to 80 kg by 1990 and reach 108 kg by 1995. This latter figure is very high relative to African, and even Asian, standards. (It is unlikely that per capita consumption would exceed 100 kg given the experience of neighboring countries; thus import levels would probably level off.) The total consumption picture described in this scenario is one of escalation: it would rise to 985,000 tons by 1990 and to 1.62 million tons by 1995. For these years, the share of consumption attributed to imported rice would be 65 and 73 percent, respectively.

A third projection scenario postulates higher prices. Under this assumption, imports would increase moderately, with per capita consumption also rising gradually. Imports would climb to 489,000 tons by 1990 and peak at 716,000 tons by 1995. Per capita consumption would increase to 68 kg by 1990 and move up to 78 kg by 1995. Total consumption would reach 834,000 tons by 1990 and hit 1.16 million tons by 1995, with imports' share of consumption accounting for 59 percent in 1990 and 62 percent 5 years later.

The fourth projection scenario is one in which population would slow. In this case, rice imports would continue their growth, but not as fast as in the base run scenario. Imports would climb to 538,000 tons by 1990 and increase to 794,000 tons by 1995. Per capita consumption would rise to 73 kg by 1990 and to 87 kg by 1995. By 1990, total consumption would reach 883,000 tons; by 1995, it would peak at 1.24 million tons. The share of consumption ascribed to imports would be 61 percent in 1990 and 64 percent by 1995.

Wheat. Wheat constitutes an important part of the Ivorian diet, although little of it is grown at home.

[7]The historical growth rate of milled rice production from 1970 to 1984 was 5.2 percent.

Imports of this staple are sensitive to changes in import prices and population growth, and insensitive to changes in per capita income. In the base run, the wheat model projects that imports would grow from 206,000 tons in 1984 to 309,000 tons in 1990. By 1995, imports will escalate to 425,000 tons. Per capita consumption would increase from 21 kg in 1984 to 25 kg in 1990 and reach 28 kg by 1995.

The wheat model, in the second projection, portrays a scenario of lower prices. Here imports would reach 328,000 tons by 1990 and advance to 478,000 tons by 1995. Per capita consumption would increase from the base run to 27 kg in 1990 and to 32 kg in 1995.

In the third projection, which forecasts higher prices, imports would increase to 291,000 tons by 1990 and climb to 382,000 tons by 1995. Per capita consumption levels under this scenario increase to 24 kg by 1990 and to 26 kg by 1995.

The fourth projection, with slowed population growth, forecasts a situation in which imports would increase to 301,000 tons by 1990 and to 390,000 tons by 1995. Under this scenario, per capita consumption levels would increase. They would rise to 25 kg by 1990 and edge up to 28 kg by 1995.

Meats. In direct response to the Sahelian drought in the 1970s, Ivorian herdsmen cut back on livestock. The country experienced a consequent upturn in beef imports to satisfy consumer pressures. These imports, of mostly packaged fresh and frozen beef, are highly sensitive to changes in per capita income, population growth, and import prices.

Source: (9).

In the base run, imports would grow to 15,000 tons by 1990 and to 20,000 tons by 1995. For the lower price (or second projection) scenario, imports are estimated to rise to 17,000 tons by 1990 and to level off at 25,000 tons by 1995.

For the higher price (or third projection) scenario, imports would rise more slowly to 13,000 tons by 1990 and to 17,000 tons by 1995. In the fourth projection, which forecasts a slowed population rate, imports would increase to 15,000 tons by 1990 and to 19,000 tons by 1995.

Milk Products. Little commercial dairy production exists in present-day Ivory Coast. The country depends upon foreign suppliers to meet its urban consumption demands. Though imports are insensitive to changes in per capita income and import prices, they are highly responsive to population changes. Projections of milk products, in the base run, indicate that imports would rise to 84,000 tons by 1990 and would reach 120,000 tons by 1995.

Looking at projections generated by the low-price scenario, imports of milk products would increase to 88,000 tons by 1990 and to 133,000 tons by 1995. Under the high-price scenario, imports would rise to 80,000 tons by 1990 and advance to 109,100 tons by 1995. In the fourth scenario, imports would increase to 82,000 tons by 1990, then climb to 109,000 tons by 1995.

Vegetables. Potatoes, onions, and canned tomatoes or tomato paste constitute Ivory Coast's major vege-

table imports. These basic food items are now widely consumed throughout the country. Of the commodities under review, vegetables are the least sensitive to changes in import prices. The same holds true for population growth, although responsiveness is still high. Per capita income for this commodity group is insignificant. In sum, the analysis suggests that both price and population changes will have little impact on the quantities imported.

Import demand, based on statistical modeling, points to various quantity levels. In the base run, imports are projected to rise to 52,000 tons by 1990 and to 64,000 tons by 1995. Under the low-price scenario, imports would increase to 54,000 tons by 1990 and to 68,000 tons by 1995. For the high-price scenario, imports would slow to 51,000 tons by 1990 and would then advance to 61,000 tons by 1995. In the fourth scenario, imports would rise to 51,000 tons by 1990 and to 61,000 tons by 1995.

Prospects for U.S. Trade Expansion

The Ivory Coast stands out dramatically from Sub-Saharan Africa in terms of political stability and economic development. Though recently it experienced negative real economic growth and a liquidity crisis, it was still able to buy its food imports on commercial terms at a time when many countries on the African continent were coping with overwhelming economic and agricultural problems.

Ivory Coast's future will be determined by its ability to sustain its current economic recovery. To a large extent, this will continue to be dependent upon external factors, such as demand for its key export crops, the value of the French franc, and interest rates. Excellent cocoa harvests for the past two seasons, along with high world coffee prices brought on by drought in Brazil, have combined to boost the Ivorian economy during 1985 and 1986. Ivory Coast's large foreign debt will continue to overshadow the economy in the foreseeable future.

The Ivory Coast has made great strides at improving agricultural and food production. However, agricultural imports have risen for many reasons. Higher income levels have led to improved diets and the desire for luxury foods. Imports of certain commodities have risen because the Ivory Coast recognizes that it cannot produce those items (particularly wheat and milk products) for mainly economic reasons. Further, rapid urbanization (particularly of foreigners) has fueled consumer demand for more convenience foods, grain staples, and a greater variety of foods originating from abroad.

Thus, increased Ivorian imports have various implications for exporting nations such as the United States. In the projections made in this study, we have presented some of the factors that directly affect the export outlook. An attempt has been made to predict trends for food demand based upon various scenarios. Using the scenarios with built-in assumptions, imports would reach various projected levels by the year 1990 (table 22).

In terms of quantity, the biggest growth areas for imports will be in rice and wheat. However, the United States has had little success in cracking the market for these two commodities. Evidence indicates that in recent years this has been due primarily to the U.S. dollar's high exchange rate which makes U.S. commodities uncompetitive. American rice,

because of its high quality, is considered a preferred item, which at one time constituted a significant portion of Ivorian imports. Given the U.S. Food Security Act of 1985 (with a provision leading to an effective reduction in U.S. rice prices on world markets), the decline of the dollar, and the Ivorian economic recovery, it is reasonable to assume that the United States can regain some of its market share of rice in the next few years.

The Ivory Coast's importation of wheat has grown rapidly since the last decade. Since 1970, France has had a lock on the market, capturing no less than 90 percent. It is not likely that the United States will break this hold, unless it offers an Export Enhancement Program (EEP); even then, the Ivory Coast might not take it for political reasons. Such a move is sure to cause friction between the Ivory Coast and France and between France and the United States.

From 1970 to 1984, milk and vegetable imports have shown steady growth. Though the Ivorians are not large consumers of milk, imports have grown rapidly since the Ivory Coast has not developed a commercial dairy sector. Imports of these two commodity groups are now dominated by EC countries, who, among other things, have a transportation cost advantage over the United States. To break into these areas, the United States should look to labeling products in French and packaging them in metric quantities. These measures would enhance product salability

with French-speaking Ivorians who traditionally use the metric system.

Given the drought that affected neighboring countries' livestock, Ivorian meat supplies from traditional sources are likely to be low in the short term. This means that fresh and frozen beef imports from overseas suppliers are likely to increase to meet the shortfall. France and Argentina have dominated this growing market. With some competitive pricing, the United States might be able to break in.

There are also some other areas of agricultural exports in which the United States might improve, which were not captured in the projections mentioned earlier. The United States exports small quantities of high-value tobacco: these exports might be expanded in future years. Also, as Ivorian incomes increase and diets improve, the United States might be able to export premixed grains as feed for the growing poultry industry.

Table 20—Projections of commodity import demand, by quantity

Scenario/ year	Total imports

1990	489	291	13	80	51
1995	716	382	17	109	61
Slower population growth:					
1970	78	101	1	17	19
1980	168	183	9	43	36
1984	320	206	8	51	41
1990	538	301	15	82	51
1995	794	390	19	109	61

Future agricultural imports of the Ivory Coast will depend upon domestic agricultural production, sustained economic growth, population growth rate patterns, and the effects of exchange rates on import prices. Given those factors and the current situation, there is room to expand U.S. agricultural exports.

1990	73	25	1	7	4
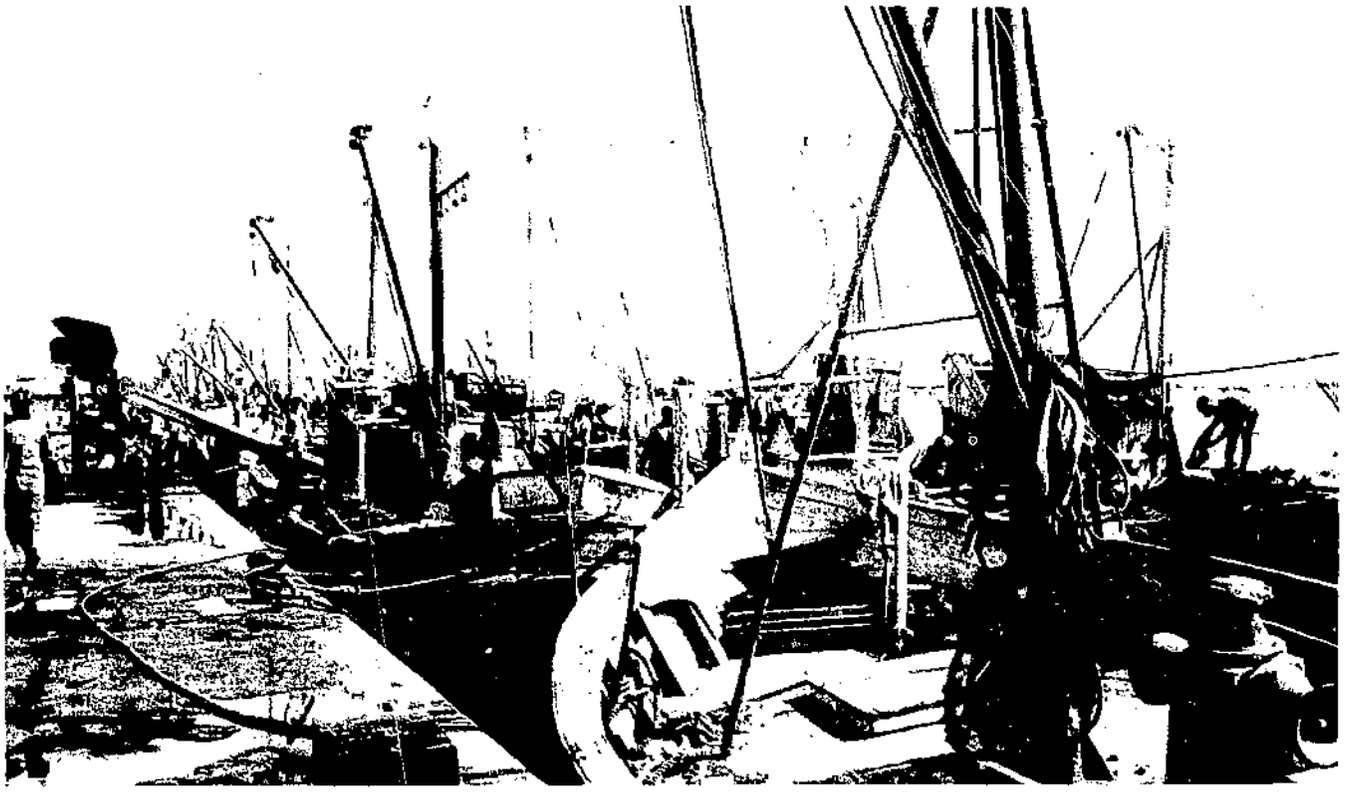
1995	87	28	1	8	4

[1]The per capita consumption figures for rice include a trend production scenario. For the other commodities, the per capita consumption figures represent only import consumption, which, in the case of wheat, reflects overall consumption.

Table 22—Projections of major commodity imports for 1990

Commodity	Scenario			
	Base run	Lower prices	Higher prices	Slowed population growth
	Metric tons			
Rice	557,000	640,000	489,000	538,000
Wheat	309,000	328,000	291,000	301,000
Meats	15,000	17,000	13,000	15,000
Milk products	84,000	88,000	80,000	82,000
Vegetables	52,000	54,000	51,000	51,000



Boats line the harbor in Abidjan, Ivory Coast's capital and largest city. The coastal city, with a population of 2.1 million, serves as a major port of entry for imports.

Appendix 1—Methodology

Neoclassical theory of demand and the authors' knowledge of the Ivory Coast suggested the choice of explanatory variables in this analysis. The appendix thus describes the methodology used. The specification of import demand functions is discussed extensively in other sources such as item (7) of the References.

Equations and Variables

In the analysis,

$$Q_i = F(Y, P_i, T)$$

where Q_i = quantity imported of commodity i;
Y = per capita income; P_i = price of i; and
T = population.

The authors hypothesized that the quantity imported would be positively related to population growth and per capita income, and negatively related to the commodity's import price.

For all commodities or commodity groups, the authors measured per capita income as real GDP in CFA franc terms, divided by the country's population.

Prices were measured as the import unit values in CFA franc terms, deflated by the implicit GDP deflator of the Ivory Coast. This was done so that import prices were measured in relation to the general domestic price level. The source for the population variable was the U.S. Bureau of the Census, International Division.

The authors judged production to be nonexistent, negligible, or of a differentiated nature for the commodities or commodity groups. The exception was rice, which was originally included in the equation, but was later excluded when it was found to correlate highly with population.

The method of estimation was ordinary least squares. For all equations, the log-log form was used (app. table 1).

Projections

Projections of quantity imported for 1990 and 1995 were based on the equations for each commodity group. The independent variables were forecast at their historical growth rates. The dependent variable (imports) was calculated, however. The historical growth rates of explanatory variables were derived by regressing the independent variables

Appendix Table 1—Import demand equations

	Summary of regression analyses using log-log form							
Commodity	Constant	Per capita income	Population	Import price	$\overline{R^2}$	Durbin-Watson	Degrees of freedom	Form
Wheat	-1.92 (-1.19)[3]	0.24[1] (0.24)	1.64 (3.06)	-1.11 (-1.77)	65.5	2.58	11	OLS[2]
Rice	-6.50 (-2.12)	— —	2.47 (1.57)	-2.46 (-4.09)	60.3	1.58	12	OLS
Meats	0.04 (0.02)	2.04 (1.45)	1.62 (2.54)	-1.98 (-6.42)	95.4	2.57	10	OLS
Milk products	-2.27 (-4.99)	0.75 (1.90)	1.86 (9.62)	-0.98 (-5.68)	94.9	2.58	11	OLS
Vegetables	-1.17 (4.29)	-0.05 (-0.16)	1.05 (7.17)	-0.52 (-3.66)	95.0	1.95	10	OLS

d.f.[4]	a = 0.05[5]
10	1.812
11	1.796
12	1.782

[1]These coefficients are elasticities; regressions are in log-log form.
[2]OLS = Ordinary least squares.
[3]Numbers in parentheses are t-statistics.
[4]d.f. = Degrees of freedom.
[5]a = alpha.

over time (Ln B = a + $\underline{B}$*Time). Projections were done in log-log form, and then exponentiated back to their linear form.

Prices were held constant at current levels in the base run.[1] Alternative scenarios were created by raising and lowering the real import prices by 10 percent by 1995 (accounting for inflation and exchange rates).

The projections derived from these models assume that present trends will continue in the future. This may not be the case, and therefore one should interpret the projections cautiously. Changes in events and circumstances may lead to shifts in demand. For example, worldwide supply disruptions for key commodities could result in highly volatile domestic prices—factors outside the control of the importing country but which affect it. Internal changes, ranging from policy decisions to infrastructural improvements that boost domestic production could affect imports as well. The models only suggest that if past trends continue, a certain projection is a likely outcome.

Appendix 2—Data Sources

An important undertaking preliminary to the study was the development of a data base that includes a 15-year series of data from 1970 to 1984 on the quantity and value of imports of major food commodities. The data base uses United Nations (UN) trade data, which each reporting country supplies. In the case of the Ivory Coast, the authors judged the Ivory Coast Government for imports to be reliable. (In contrast, data supplied by some other countries might be judged unreliable. In such cases, researchers would be wise to use exporting countries' data.)

[1]This is not to say that prices are likely to remain constant. The recent history of world commodity prices, as figures 4 and 7 show, reveals great price volatility. Projections of any sort of price data are risky; therefore, the base run model initially attempted to neutralize this variable as much as possible.

For all commodities or commodity groups, the Standard International Trade Classification (SITC) codes are noted in Appendix 3 for purposes of verification. For the year 1980, the Ivory Coast did not report its imports to the United Nations. Thus, for this one year, other sources were researched and used if the data were consistent with the UN data. For 1984, preliminary data estimates, which were obtained from other sources, were used if they were consistent with the UN time series.

Appendix 3—Standard International Trade Codes (SITC)

Standard International Trade Codes (SITC) were consulted in the preparation of this report. For purposes of reference or verification, they are listed here.

Commodity	*Code*
Total agricultural imports	00
Beef	0111
Canned meats	013
Milk products	022
Fish	032
Wheat	041
Rice	042
Corn	044
Wheat flour	046
Fresh vegetables	054
Prepared vegetables	055
Coffee	071
Cocoa	072
