The Identification and Formation of Clusters of Northeastern United States Farms Participating in Multifunctional Activities

Ioana (Julia) I. Marasteanu, The Pennsylvania State University; Dr. Chyi-Lyi (Kathleen) Liang, University of Vermont (Principal Investigator); Dr. Stephan Goetz, The Pennsylvania State University, Northeast Regional Center for Rural Development

In collaboration with Dr. Mary Ahearn (USDA ERS), and Dr. Jason Brown (Federal Reserve Bank)

Project Funded by USDA AFRI Foundational Grant# 2011-67023-30106

Introduction

The purpose of this research is to investigate factors impacting farmers' decisions to engage in multifunctional activities, which are hypothesized to enhance the sustainability and prosperity of farms and their communities. To achieve this research goal, I will break it up int two specific objectives. The first objective is to identify statistically significant hot spots of farms participating in multifunctional activities (i.e., clusters of postal areas with highly correlated, large numbers of farms participating in multifunctional activities). The second objective is to investigate the variables that impact the spatial distribution of farms participating in multifunctional activities as well as the variables impacting the likelihood o participating in and the level of participation ir multifunctional activities. The results of this research may have implications for policies related to encouraging farm participation in multifunctional activities.

Methodology:

Identifying clusters

Local Moran's I (Anselin, 1995) $I_i = (x_i - \bar{X}) \Sigma_{j \neq i} w_{ij} (x_j - \bar{X})$ Z-statistic used to test the **null hypothesis of no spatial autocorrelation**:

 $E(I_i) = \frac{-\sum_{i \neq j} w_{ij}}{n-1}$ $V(I_i) = E(I_i^2) - E(I_i)^2$

Analyzing factors affecting spatial distribution while accounting for spatial lag and error:

Spatial Autoregressive Models

General spatial autoregressive model (Lesage, 1998; Anselin, 1999):

 $y = \rho W_1 y + x\beta + \mu,$ $\mu = \lambda W_2 \mu + \varepsilon,$ $\varepsilon \sim N(0, \sigma^2 I_n)$

Different versions of this model are based on the presence of the weighting matrices

Results of Local Moran's I analysis (based on the weighted counts of farms participating in MFAs) Red = high-high, Pink = high-low, Purple = low-high, Blue = low-low, White = not significant, Grey = no data Farms participating in any form of multifunctional activity Farms participating in agritourism Farms participating in direct market sales Farms participating in value-added Farms participating in off-farm activities

Relevant zipcode- and county-level variables

Variable Descriptions								
/ariable	Level	Description						
nummultiw	zipcode	weighted* number of farms participating in MFAs in general						
numagrtw	zipcode	weighted number of farms participating in agritourism						
numdmsw	zipcode	weighted number of farms participating in direct market sa						
numvalueadw	zipcode	weighted number of farms participating in value added						
numofffarmw	zipcode	weighted number of farms participating in off-farfm activities						
number_respondents	zipcode	number of respondents to the survey						
population_farms	zipcode	total number of farms determined by the 2007 Census of Ag						
farm_receipt_per_op	county	receipts of income and farm related totals measured in dollars per operation						
fed_gov_receipt_per_op	county	federal government program receipts measure in dollars per operation						
dist_from_majorcity	zipcode	distance of the zipcode area from a major city measured in kilometers						
ag_forest_fish_hunt	zipcode	number of establishments in agriculture, forestry, fishing and hunting						
Averagefamilysizee	zipcode	average family size						
medianage	zipcode	median age of total population						
valuelandperacre07	county	value of land and buildings per acre						
hhwithunder18	hhwithunder18 zipcode number of households with children u							
unemp11	county	unemployment rate in 2011						
0to4907	county	number of farms size 0-49 acres (small)						
cropins_op	county	number of operations participating in crop insurance programs						

 $* weight_z = \frac{population_farms_z/total_population_farms}{number_respondents_z/total_respondents}$

Rationale for the possible effects on the spatial distribution of farms participating in MFAs

Rationale	Variables	Expected Effect
Opportunity Cost: A high value of assets implies a high opportunity cost of	valuelandperacre07	negative
using them for multifunctional activities	farm_receipt_per_op	negative
	naturalamenScale	negative
Resources: Farmers may be more inclined to diversify if conditions are	ag_forest_fish_hunt	positive
favorable, and if they are able to exploit their resources	shareorg_with_sales	positive
	0to49acres_07	negative
	Averagefamilysize	positive
	Medianage	positive
	fed_gov_receipt_per_op	positive
Risk: Farmers engage in diversification and off-farm activities to offset the	ag_forest_fish_hunt	negative
risk/variation in income that comes from devoting their time to their regular	shareorg_with_sales	negative
farming activities. Variables related to agricultural conditions and agricultural	republican	ambiguous
market conditions can be indicators of risk.	fed_gov_receipt_per_op	negative
	farm_receipt_per_op	negative
Avalilability of off-farm work: farmers are more inclined to engage in off-farm	dist_from_majorcity_km	negative
work if it is available	unemp11	negative
Constraints: Family situations may make it difficult to pursue off-farm work	Averagefamilysize	negative
	hhwithunder18	negative
Landscape: Attractiveness of landscape drives diversification	naturalamenScale	positive
Sustainability: High environmental sustainability drives multifunctional	fedconsvwet	positive
systems	republican	ambiguous
Market access: proximity to roads and urban centers provide market access	dist_from_majorcity_km	negative
which encourages the development of farm operations	, ,_	
Urban Sprawl: Protection from sprawling development may be beneficial to	dist_from_majorcity_km	positive
farm viability		
Family: Diversification can be used as a means to create more on-farm	Averagefamilysize	positive
employment for family members	hhwithunder18	negative
Crop Insurance: Crop insurance encourages specialization	cropins_op	negative

Results (Spatial Autoregressive Models)

naturalamenScale

Results of maximum likelihood estimations of the general spatial autoregressive model for the weighted number of farms participating in MFAs in general, as well as for the weighted number of farms participating in specific categories of MFAs. The independent variables are zipcode- and county level variables that correspond to the rationale table above. An inverse distance weighting matrix is used for all models, with the exception of "numdmsw," which uses a queen contiguity weighting matrix.

Further Research

- Using the already identified hotspots and coldspots:
 - Determine the zipcode- and county-level variables affecting the likelihood that a postal code area belongs to a hotspot or coldspot
- Using data from another, more in depth, survey of farmers about MFA participation:
 - Determine the farm-level variables affecting participation in MFAs
 - Determine whether self-identified farmer characteristics related to innovativeness and creativity impact participation in MFAs, while accounting for possible endogeneity
 - Determine factors impacting the likelihood that a farm is in a hotspot or coldspot
