Kansas State University
December 30, 2005

## Introduction

Midland Marketing Co-op (MMC) is a very profitable medium to large-sized local grain marketing and farm supply cooperative. It does business at the retail level with farmers and other retail customers by buying farmer-produced grain, mainly wheat and milo (grain sorghum) but some sunflowers, corn and soybeans, and by selling farm inputs, primarily fertilizer, chemicals, petroleum and feed. MMC markets the grain it purchases by selling to industry buyers such as processors and exporters. MMC purchases the farm inputs it intends to sell to producers from various industry suppliers including manufacturers, wholesalers and distributors. It is headquartered at Hays in North Central Kansas and operates facilities in eleven locations in five counties (See Exhibit 1 for a map of the locations and trade area.) It operates grain elevators in all eleven locations and fertilizer, chemical, feed, and petroleum businesses at several of these locations. The feed business includes two feed mills, at Hays and McCracken. The petroleum business unit includes the operation of service stations at two locations, Hays and Plainville. Three of the locations are operated under a lease with a purchase option, Brownell, McCracken and Palco. The company had 45 full-time employees in 2005.

MMC has been and continues to be primarily focused on the grain business and has operated profitably for at least 25 years. In the period, 1999-2004, around 73 percent of sales were grain sales, above the typical co-op's percentage of 62 percent. In fiscal year 2004 it had grain sales of $\$ 28.3$ million and farm supply sales of $\$ 11.5$ million, for total sales of $\$ 39.8$ million. Based on 1999-2004 comparative data for a group of about 180 peer local co-ops in the states of Kansas, Nebraska, Colorado and Oklahoma, they ranked in about the $77^{\text {th }}$ percentile (P77) in sales, meaning 77 percent of peer cooperatives had sales lower than their sales. Net earnings before taxes in 2004 were $\$ 1.49$ million, of which $\$ 1.40$ million, or 94 percent, were from local operations. Total assets at fiscal year end 2004 (December 31, 2004) were $\$ 14.3$ million and total equity was $\$ 9.25$ million or 65 percent equity to assets. Based on 1999-2004 comparative data, they were in about the 76th percentile (P76) in their peer group on total assets and the $70^{\text {th }}$ percentile (P70) on the strength of their balance sheet based on the solvency measure, equity to assets. But in 2004 their equity to assets percentile had increased to P83.

It has three kinds of asset investments. In 2004, outside investments totaled about \$1.36 million, including (1) $\$ 0.49$ million invested in other cooperatives, primarily the CHS regional cooperative, (2) $\$ 0.44$ million in joint venture LLCs, primarily the Westland Terminal train loader, and (3) \$0.43 million in other investments. Local net fixed assets totaled $\$ 2.2$ million. As will be noted in a later section on past performance, MMC is especially efficient in use of fixed assets. Net fixed assets ranked in the $55^{\text {th }}$ percentile compared to a sales ranking of the $75^{\text {th }}$ percentile in 2004.

MMC has experienced a path to profitability that can be labeled, "Good to Great." From 1980 to 1994 they had average to above average local earnings profitability, ranking in the $78^{\text {th }}$ percentile for the 6-year period, 1980-86, and the 63 ${ }^{\text {rd }}$ percentile for 1986-95. Beginning in 1994 profitability began trending up, relative to the industry peer group, reaching the top ten percent in the peer group in most years, 2000-2004. This uptrend followed by one year the naming of Vance Westhusin as the new CEO. In the three-year period, 1996-98, MMC ranked in the $89^{\text {th }}$ percentile and the five-year period, 1999-2004, ranked in the $96^{\text {th }}$ percentile. Return of sales profitability in 2004 was 3.7 percent and return on equity was 15.8 percent. During 1999-2004 they averaged 3.2 percent return on sales, putting them in the 95th percentile (P95), and they averaged 12.9 percent return on equity (ROE), putting them in $95^{\text {th }}$ percentile (P95). In the last

25 years, 1980-2005, ROE has ranged from a low of minus 4.2 percent in 2002 (P35), the year of the Farmland Industries investment cancellation, to a high of 24.9 percent in 1980 (P83). The three year period, 1989-92, was their lowest performing multi-year period, compared to their peer co-ops, when they averaged 7.33 percent ROE and a P61 ranking.

The purpose of this case study is to document MMC's performance and to describe their history, competitive situation and the characteristics of their operation, organization and leadership. Our ultimate challenge and purpose is to understand the nature and role of those critical factors that lead to high performance of local co-ops like MMC. These factors can be divided into two broad groups, (1) internal performance factors related to the company or firm itself that are viewed as controllable, resulting in what are frequently called "firm effects," and (2) external performance factors related to the general economic environment that are viewed as uncontrollable and often unpredictable, resulting in what are frequently called "industry effects." Internal factors of interest are strategy, execution, culture, structure, talent, innovation and leadership. External performance factors of interest are general economic conditions like crop production (bushels produced and acres farmed), relationships with customers and partners, relationships with and behavior of competitors, and the relationships competitors have with common customers.

## History, Locations and Trade Territory

MMC was organized on January 6, 1915 in Hays under the name of Farmers Cooperative Association (of Hays). This generic name was used by many co-ops organized in the early 1900s and a few of those early co-ops still bear this name. The name was changed to Midland Marketing Co-op, Inc. in 1993. The first attempt to organize a co-op in the Hays area occurred in 1906 when a few progressive farmers saw the need for a grain elevator owned by farmers. They organized the Farmers Grain Shipping Association and built an elevator, warehouse and office where the current feed mill and warehouse now stand with a \$5,000 capital subscription from charter members. They contracted with the Kansas Flour Mill Company of Enterprise, Kansas, to operate these facilities. This first attempt failed after a few years due to financial problems and the assets were bought by Kansas Flour Mill.

With the help of the Farmers Union local organizations in the area another organizational effort was started in 1914 and the Farmers Cooperative Association was successfully incorporated and a board of nine directors was elected from among the original 81 charter members. Nineteen days later, on January 25, 1915, they bought the elevator and related facilities for $\$ 5,000$ the earlier failed co-op had sold to Kansas Flour Mill. The charter members raised $\$ 10,000$ of capital to finance the new business venture. But more trouble beset them almost five years later when, on November 19, 1919, a neighboring business's gasoline storage tank exploded, causing a fire that burned down all their facilities, including a coal shed that had been added. The farmers in the area rallied again and raised $\$ 25,000$ in 1920 to rebuild the facilities and to also buy another elevator in Yocemento for $\$ 7,500$ from Hays City Flour Milling.

In about 1930 a bulk gasoline and oil distributing business was set up as farmers began switching from horse power to tractor power.

The depression of the 1930s was at its peak in 1933 and the co-op nearly went into bankruptcy. They survived this time of financial trouble, poor crops and dust storms with the help of the Wichita Bank for Cooperatives and the commitment of their members.

In 1935 a feed grinding and mixing business was added. Shortly after this, a service station and cream station were added.

On January 1, 1939 the association changed it business form to be strictly a membership organization that was 100 percent cooperative to take advantage of the Capper-Volstead Act of 1922. At that time the membership fee was set at $\$ 10$ and they began operating on a traditional cooperative basis, including the use of the revolving fund system of equity management.

The growth of the business accelerated during and after World War Two. Membership had expanded from 81 charter members to 176 to over 1,000. Storage capacity for wheat had become a problem and capacity was expanded numerous times in the 1940s and 1950s by leasing facilities in Hays and Toulon in 1941 and by constructing the first concrete elevator in 1947 in Hays with 200,000 bushel capacity. Additional storage was built in 1950 and 1954, raising capacity to 865,000 bushels in Hays.

The first merger took place in 1957 when the Plainville Oil cooperative was absorbed. Numerous grain elevators were built in the late 1950s including branch elevators at Yocemento, Plainville and Toulon. By 1960, the four elevator locations had storage capacity of about 3.6 million bushels.

MMC absorbed three other co-ops in mergers with Zurich in 1966, Natoma Cooperative Association in 1982 and Farmers Union Cooperative of LaCrosse in 1992. Today there are grain elevators in all eleven locations with a total storage capacity of 8.6 million bushels.

Their trade area is a very productive area for wheat and grain sorghum but has high variability, ranging from 25 to 50 million bushels of annual production in the last 10 years. Research suggests that co-op profitability is highly correlated to bushels produced and handled. (See Exhibits 2, 3 and 4.)

## Customers, Income Distribution and Equity Management

MMC's primary customers are agricultural producers, mainly crop producers, who sell grain to the co-op and buy farm inputs from the co-op. These producer-customers have three additional relationships with the co-op because of the unique nature of businesses that operate on a cooperative basis. These customers are also (1) members who have a vote, (2) patrons who receive a share of the profits based on their use or patronage of the co-op through the distribution of profits in the form of patronage refunds (cash and retained), and (3) owners who have an equity investment. Each customer's equity investment is made primarily through the distribution of retained patronage refunds, which are redeemed for cash at a later time. The income distribution and equity management program, in combination with the financial performance and policies of the co-op, determine the amount and timing of (1) cash and retained (non-cash) distributions of profits and (2) cash and non-cash equity investments and redemptions.

The primary benefit of a cooperative like MMC, in the minds of most producercustomers, is the customer relationship itself, not the patron, owner and member relationships also associated with co-ops. Access to products and services desired by producers at competitive prices is a major justification for the cooperative form of business. A prerequisite to business success is being competitive in the marketplace, whether the business is a cooperative or not. An obvious first question is, "How competitive are the co-op's prices, given the availability and quality of the products and services offered by MMC?" Since patronage refunds are essentially an adjustment to the price received by producers for grain sales to the co-op and for prices paid by the producer for farm input purchases, the distribution of patronage refunds and the
management of the retained portion, including the redemption of the retained portion are factors of interest. An obvious second question is, "How are those prices viewed, given the distribution of profits and the redemption of equity by MMC?" We will address the second question in this section and the first question, to the extent possible, in the next section on competitors and the marketplace.

MMC has 1,067 producer-customers who are also voting members, patrons and owners. It also allows other customers to be patrons and owners and has 1,384 of these non-voting patron-owners for a total of 2,451 voting and non-voting patrons. The non-member customers who are treated on a patronage basis are called participating patrons. Both members and participating patrons are expected to have an equity investment in the co-op. Each voting member has two classes of equity investment. MMC is a non-stock company, so instead of having common stock to convey membership as done in stock companies, they have an equivalent class of equity called a "Membership Certificate." First, each member is expected to hold one unit of membership equity (ME) with a par value of $\$ 500$. No cash investment is required, so this first $\$ 500$ is earned through the distribution of retained patronage refunds. Second, all accumulated retained patronage refunds, exceeding $\$ 500$, are held in a book credit class of equity called "Revolving Fund" on the balance sheet, but also sometimes referred to as "Deferred Patronage Dividends" by management.

Each participating patron is not currently expected to have an initial \$500 investment, with a corresponding "Participating Certificate." All of their retained patronage refunds are distributed into the equity class, Revolving Fund. MMC is considering whether to apply the \$500 requirement to participating or non-voting patrons just as they do for member or voting patrons.

Income distribution. Income distribution decisions are made following the end of the fiscal year, which is December 31. Patronage refunds, including the cash patronage refund is paid at the annual meeting in March, less than three months after the end of the fiscal year. MMC's patronage business is typically around 90 percent of total business as measured by the percentage of total earnings before income taxes distributed as patronage refunds (often called patronage dividends). In 2004 patronage refunds were 88.4 percent of total earnings. During the last 10 years, 1995-2004, they have varied from a low of 74.6 percent in 2001 to a high of 101.5 percent in 1997.

All their patronage earnings are distributed as qualified patronage refunds, thereby creating a deduction from the taxable income of the cooperative and simultaneously passing on the income tax obligation to the producer-patron. Cash patronage refunds have been 30 percent for distributions on the fiscal years, 1995-2004. Therefore, for at least 10 years MMC has paid a little less than enough cash to cover the income and Social Security (FICA) tax obligations of their producer-patrons in the year of distribution, estimated to be in the range of 35 to 45 percent. This moderate cash patronage rate is not viewed by MMC as a major competitive disadvantage in their trade territory. (See Exhibit 5 for information on patronage distributions.)

MMC has three patronage pools and their patronage rates per unit of business are relatively high. The overall return on sales in 2004 was 3.9 percent, compared to the typical coop's rate of 1.7 percent. MMC has three patronage pools and this resulted in the following 2004 patronage rates by pool: (1) grain receipts, 9.3 cents per bushel, (2) direct grain delivered, 0.9 cents per bushel, and (3) farm supply, 6.3 percent. Since there is no grain storage patronage pool storage income is included in the grain receipts pool. Also, it is deliveries of grain by patrons for sale or storage that is measured, not just sales of grain by the producer to the co-op. Over the five year period, 2000-2004, these rates have averaged (1) 7.0 cents per bushel on grain, (2) 1.0 cents
per bushel on direct grain, and (3) 4.1 percent on farm supplies, and this included the 2002 year when rates were zero due to the Farmland Industries investment write-down. (See Exhibit 6 for patronage rate information.)

These high per unit rates are also considered a major competitive advantage in their trade area because they can be viewed as an adjustment to the original transaction price. Grain sales to the co-op by producers returned more and farm input purchases from the co-op by producers cost less.

Non-patronage earnings are taxable to the cooperative and are distributed to "Retained Earnings", net of taxes. They are unallocated equity or undivided earnings and constitute another class of member equity.

Equity management. The two classes of allocated equity, Membership Certificates (MC) and Revolving Fund (RF), are managed using specific investment and redemption policies. Equity investment by producer-owners is obtained entirely from retained patronage refunds. In other words, producer-members are not required to make any cash investment to obtain the profit distribution benefits of doing business with a cooperative.

As noted previously, the first $\$ 500$ of retained patronage refunds is distributed to MC. MC is only redeemed (re-purchased) by a cash payment to a producer-owner if one of several special circumstances occur, triggering a special redemption, if approved by the board of directors. Special redemptions of MC are made for the following two reasons: (1) estate settlements and (2) special requests. MMC has an unusual provision in their policy that allows any member, regardless of circumstances, to request forfeiture of their voting member status. If approved only their $\$ 500$ membership investment is redeemed. A non-cash redemption of member equity may be made as a setoff against bad debt, and only as a last resort, such as in the case of the bankruptcy of the member with a court ordered setoff. Bad debt is incurred when an account receivable is not paid by the member. MMC always sues for a judgment before considering a setoff. Therefore, MC is a semi-permanent form of equity investment, redeemable only at the end of the business or member relationship between the member and the co-op.

All retained patronage refunds that are distributed after satisfying the $\$ 500 \mathrm{MC}$ requirement for members are distributed to the second class of allocated equity, named "Revolving Fund" (RF). In the case of participating patrons all refunds go to RF. RF may be redeemed under the same special redemption policy as applied to CS. The primary redemption method used is revolving fund. A revolving fund redeems the oldest equity first, based on the year of issue or distribution, or in other words on a first-in, first-out basis.

MMC has a relatively short revolving fund of 8 years or 7 years, depending on how you count years. This relatively short revolving cycle is considered a major competitive advantage in their trade territory with their customers. Following the close of the 2004 year, the RF equity retained from 1996 business. Therefore the unredeemed RF equity was retained from the years, 1997-2004. However, the 2002 year has no equity investment because it was a loss year so there are only 7 years of equity remaining to be redeemed. Special estate settlement redemptions are made on a monthly basis based on approved requests. Cash patronage refunds and revolving fund redemptions are redeemed in March, less than three months following the close of the December 31 (calendar) fiscal year end. (See Exhibit 5 for equity redemption information.)

This combination of income distribution and equity redemption policy means that each patron receives 30 percent of their patronage refunds, their pro rata share of the patronage earnings (profits), as a cash distribution soon after the end of the year and the remaining 70 percent of the patronage refunds as a cash distribution 8 years later. For example, the 2004 grain
distribution of 9.3 cents is a price adjustment or price increase on grain deliveries by farmerpatrons, distributed in two parts: about a 2.8 cent per bushel cash patronage refund within about two months following the close of the fiscal year and the balance of 9.3 cents or 6.5 cents per bushel 8 years later (or sooner if the revolving cycle shortens in the future).

In any year, the combination of cash patronage refunds and cash equity redemptions will represent a distribution of profits to current and previous patrons. One interesting metric is the percent of a year's total patronage income that is distributed as cash patronage refunds and cash redemptions of deferred or retained patronage refunds. An ideal might be to average 100 percent since that means patrons are getting all their patronage refunds in cash. Some co-ops try to set an upper limit on payout, such as 50 or 60 percent, but this is not an effective way to manage the balance sheet and cash flow. Most co-ops pay out much less than 100 percent but the most profitable co-ops pay a very high percentage. MMC paid out 53.5 percent in 2004 but averaged 77.7 percent over the five year period, 2000-2004. (See Exhibit 5.)

## Competitors and Marketplace

MMC has numerous competitors. Generally speaking, MMC's biggest competitors are the six diversified local co-ops whose trade areas are adjacent to MMC's trade area. They are headquartered in Ellis, Gorham, Osborne, Quinter, Rush Center and Stockton. All have grain, feed, agronomy and petroleum business units. (See Exhibit 1.)

Today MMC has no competitors operating grain or feed facilities in any of the eleven towns where they have facilities. Within their core trade area they have grain competitor locations at Ellis and Paradise. There is very little on-farm grain storage capacity in the trade area so MMC feels they have a competitive advantage because of their eleven country elevators with about 8.6 million bushels of storage. There are four other major grain business competitors outside their trade area: Logan Grain LLC at Logan, the Scoular train loader at Downs, the two Castle Rock Marketing train loaders at Ogallah and Wakeeney, and the U.S. Energy Partners wheat gluten and ethanol plant complex in Russell. MMC is a member-owner in the Castle Rock Marketing LLC joint venture along with Midwest Cooperative of Quinter and Cargill but they view this train loader business as a competitor to their country elevators.

MMC has numerous independent competitors in petroleum-related businesses at all of their locations, especially in Plainville, Hays and LaCrosse.

MMC's agronomy business has several cooperative and independent competitors throughout its trade area. They include one of Kansas' largest retailers, Boettcher Enterprises of Beloit, which sells products and provides application services. Other competitors who provide application services include Mid State Farmers Co-op of Rush Center and Pawnee County Cooperative of Larned to the south, Kaiser Ag to the north, and Agriliance to the west. Other major competitors who sell product but don't provide application services are Sims Fertilizer and Chemical of Osborne and Simpson Farm Enterprises of Ransom. Simpson Farm Enterprises has a location in Hays that sells seed, fertilizer and chemicals following a low margin, high volume strategy. There are also five producers who do significant custom application in the trade area.

MMC has expanded its agronomy application business in the last few years and has become higher service oriented. Major competitors are Boettcher and the co-ops at Gorham (east) and Agriliance (west). However, there are also some solid competitors who follow a high volume, low service, low margin strategy.

Overall there are at least 18 competing business locations in the counties of Rooks (2), Ellis (4), Rush (5), Ness (3), Osborne (3) and Graham (1). In addition there are the previously mentioned major grain competitors in Trego and Russell counties to the west and east.

Although MMC has many competitors, as described earlier, the CEO has an interesting view of competition. Vance Westhusin said, "My biggest competitor is my own company. I can lose more business with poor service than my competitors can take away from me."

## Leadership: Management and Board

The leadership in the company has been very stable and locally grown for many years at both the CEO and board level. Vance Westhusin, the current President and General Manager, was hired as the CEO in 1993, almost 13 years ago. Prior to his current position he worked for MMC in his hometown of Plainville as branch manager, in 1990, and as MMC's operations manager from 1991-1993. Vance is a graduate of Kansas State University with a Bachelor's degree in Feed Science and Management and a Master's degree in Grain Science, awarded in 1981 and 1983, respectively. Prior work experience included working for the Wayne Feed division of Continental Grain in both Nebraska and Kentucky from 1983-1989.

In the 91 year history of the company there have only been four managers. The manager prior to Vance was a well-known cooperative leader, Ken Herrman. He managed MMC for 22 years, from 1971-1993. He also served as a director on the board of Farmland Industries. The two previous managers were Dan Pfeifer (1934-1971, 37 years) and Walter Stanton (1919-1934, 15 years). The average length of service of the three previous managers is 25 years. (See Exhibit 7.)

The first board of directors had nine members, the same size as the current board. The board size has generally remained the same for over 90 years. The board membership has also been stable with relatively low turnover. MMC has director terms of 3 years and does not have limited terms. Incumbents often run unopposed but additional potential candidates are invited to stand for election and do so about 40 percent of the time.

MMC puts a high priority on director training and education and has as high an expectation of performance for directors as they do for employees. They conduct an annual board retreat in which they seriously address strategic issues and get updated on major industry issues by outside experts. Attendance at training sessions, the board retreat and regular board meetings is required. Compensation for directors is $\$ 200$ per meeting or per day, $\$ 100$ per day for travel days, and travel expenses. The new associate director program was implemented in 2003.

At least 98 different directors have served on the elected board over 81 years, 1915-2006, so the turnover has been on average, a little more than one director per year. The 89 former directors served an average of 7.7 years with range of service from less than one year (J.R. Chittenden, 1919, and others) to 32 years (R. A. Leiker, 1924-1942 and 1943-1957). The nine current directors have served an average of 13 years with range of service from one year to 26 years. There were 15 directors who went off the board for one or more years and then were elected back on the board, an unusual pattern of service in most co-ops. The current chairperson of the board, Kent Stamper, is one of those directors. He has served a total of 26 years in two segments, 1976-1988 and 1992-2006. MMC recently began an associate director program in which two associate directors are appointed, each with two year terms. This program is expected to be effective in providing successful candidates for open positions in the future. The newest
member of the current board is the first director to have served as an associate director prior to election.

There has also been stability in the employee positions at both the managerial and frontline level. More information about turnover is provided in the section on talent.

## Past Performance: Case Firm and Industry

The audited operating statement and balance sheet for fiscal years 2003 and 2004 provide recent performance information. (See Exhibits 8 and 9.) A more comprehensive financial performance profile has been created using this type of information on the case co-op and other peer co-ops over a longer period of time, 1980-2005. (See Exhibits 10-31.)

This cooperative performance profile reviews the financial performance of cooperatives in the four states of Nebraska, Kansas, Colorado and Oklahoma for the 26-year time period, 1980-2005, and the performance of the case co-op, Midland Marketing Co-op (MMC), Hays, Kansas. Multiple-year averages are calculated for the multiple-year segments, 1980-85, 1986-88, 1989-92, 1993-95, 1996-1998, and 1999-2005. These multiple year averages are for the "same firms" that appear in all the years in a multiple-year segment.

We provide a brief summary of the results and refer to the accompanying Exhibits that document the performance profile. Those interested in more information are invited to contact the author. A description of the data source and analysis is provided at the end of this section. We assume the reader has a basic understanding of financial analysis for cooperative businesses.

Performance Profile Overview. The case co-op's values are reported in a table for each selected measure and on a graph. The tables and graphs compare the performance of the case coop to itself over time and to the peer co-ops. The percentile information is the most useful way to compare a local's ratios to other cooperatives' ratios and to its own performance in different periods. The percentile results clearly illustrate the ups and downs of the entire industry and the wide variation between the top and bottom performers in the industry. Percentile results will be reported in a short form notation so that performance at the $90^{\text {th }}$ percentile will be reported as P90. If performance is P90 for a profitability measure, like return on equity, it means the case coop is performing better than 90 percent of the peer co-ops. It is possible for a co-op's ratio, such as return on equity, to decline from one year to the next but improve its performance relative to the industry. We have selected eleven measures to report. In addition to the standard financial analysis categories of profitability, liquidity, solvency and efficiency a size measure is reported. The primary focus is on the period, 1999-2004.

Profitability. Return on local assets, return on equity and return on sales are reported. (See Exhibits 10-15.) MMC's profitability has recently been at around P95 on these measures. Profitability has improved from a middle of the pack or "good" level in the late 1980s and early 1990s to a top of the pack or "great" level in the mid-1990s and since.

The pricing strategies for the grain and farm supply business units, as reflected in gross margins, are related to profitability. The four-state performance profile suggests that the highest profit co-ops in 1999-2004 tended to have low grain gross margins and moderate to high farm supply gross margins relative to the industry. However, in previous years high profit was associated with higher grain and farm supply gross margins. (See Exhibits 16 and 18). MMC has a grain gross margin of around P40 and a farm supply gross margin of around P60, consistent with the 1999-2004 pattern. (See Exhibits 16-19.)

Liquidity. The current ratio is reported, since this is the most effective way to compare the liquidity between companies. However, most companies focus more on working capital dollars than ratios when managing liquidity. MMC's liquidity has been very strong at about P80, a current ratio of about 1.9. There is a very strong desire by the CEO to utilize no significant long-term debt and to see high working capital as the primary source of funds to make cash distributions for fixed asset purchases, cash patronage refund payments and equity redemption payments. (See Exhibits 20-21.)

Solvency. The ratio, equity to assets is reported. (See Exhibits 22-23.) MMC's solvency has been strong at about P70, averaging around 62 percent. It would be much higher when viewed as a debt to equity ratio since MMC has very little long-term debt and has substantial working capital and current assets.

Efficiency. Efficiency appears to be the primary driver of profitability in grain marketing and farm supply co-ops. Numerous efficiency measures are important but the ones most important are those related to people productivity and asset utilization. Previous research suggests that the typical local co-op could improve profitability by reducing assets, especially fixed assets, and increasing resources allocated to people in a way that increases overall productivity. This generally means hiring fewer but more talented and productive people, who are more costly per person but provide the most "bang for the buck."

Personnel productivity is measured by the ratio, gross income to personnel costs. This ratio has a very high correlation with profitability. MMC's ratio has been very high at around 2.80 and P87. In other words, for every dollar spent on personnel they generate $\$ 2.80$ of gross income. This corresponds to a more common way of expressing the same relationship, the inverse of the ratio as personnel costs to gross income, by saying personnel costs are 36 percent of gross income. This performance is consistent with the CEO's strategy on people as noted in the section below on strategy.

Asset productivity or efficiency is measured by two ratios, gross income to depreciation expense, and sales to net fixed assets, an asset turnover measure. MMC's gross income to depreciation expense has been around 12.60 and P96, meaning they don't have high levels of fixed assets generating high depreciation expenses relative to gross income. MMC’s sales to net fixed assets is 15.32 and P96, meaning they generate high levels of sales per dollar tied up in fixed assets. The MMC strategy, which they execute very well, is to work people and assets very hard.

Size. It is commonly believed that all businesses improve performance as they increase in size, referred to as economies of size. Our research suggests there isn't a strong relationship between size and performance over all ranges of sizes for local grain marketing and farm supply co-ops. In fact, the moderate sized co-ops tend to be the most profitable with the smallest the least profitable and the very large, moderately profitable. But there is high variability in profitability for any size group, so many factors other than size influence profitability.

Size can be measured in many ways. We used annual sales volume in dollars as the primary measure of size. MMC's sales were at about $\$ 40$ million in 2004, putting them at P75. For the last ten years they have been at around P75 even though they have grown from \$26 million in 1994 to $\$ 30$ million in 2004, a 54 percent increase. Their rate of growth appears to be very beneficial, but as the CEO relates in the section on strategy, as the co-op has grown it has been much harder for the CEO to keep track of everything as was common in the past.

Data Source and Analysis. Farmland Industries' database of local cooperative financial statements is used as the source of 1980-95 financial performance information and the CoBank
database is used as the source of 1996-2005 financial performance information. Individual coops are not identified from one database to another, so calculations across databases are not possible. All individual firm data is confidential. The identity of each firm in the database is not provided. Individual firm data is extracted or revealed only with a firm's permission. We are grateful to Farmland Industries and CoBank for sharing their databases with K-State for the purpose of conducting research on cooperative finance issues.

A standard financial analysis is utilized.
Selected ratios are calculated in four common categories: profitability, liquidity, solvency and efficiency. Ratios are also calculated for a fifth category, product mix, such as grain sales to total sales but are not reported in this report. A sixth category, a measure of size, total sales is also reported.

Performance measures for each ratio are reported in three ways for the peer group on a table.

First, the variability from the higher ratios to the lower ratios is reported. Five measures are reported in the "percentile values" section of the tables. They are P95 (95th percentile), P75 (75th percentile or 3rd quartile), P50 or median (middle, 50th percentile or 2nd quartile), P25 (25th percentile or 1st quartile) and P5 (5th percentile). The P25, P50 and P75 values are shown in the accompanying graphs labeled as "Percentiles."

Second, the peer group measures are divided into three groups based on profitability. The profitability groups are high, medium and low. The top 25 percent of cooperatives by profitability is the high group. The middle 50 percent is the medium group and the bottom 25 percent is the low group. An average is calculated for each group. Grouping this way makes it possible to determine which factors are associated with high or low profitability and in what way. The profitability measure used to form profit groups is return on local assets, where returns are local or operational earnings before interest and taxes and local assets are total assets minus investments including regional investments.

Third, variability is also reported using a statistical measure, coefficient of variation or CV. CV is a measure of relative dispersion. It is calculated as the standard deviation of the values in a group divided by the mean or average of the values and then multiplied by 100 to convert it to a percentage. The mean and the CV are reported in the profit group portion of the tables. The CV allows us to compare the variability of a measure, such as return on local assets, between different years, such as 1980 and 1990. It also allows us to compare the variability of two or more different measures, such as return on local assets and return on equity.

Performance measures for the case co-op are calculated for the same measures as used in the percentile and profit groups. Both a value and a percentile are provided for the case co-op in the tables. The tables provide profit group and percentile information on financial measures for the years 1980-2005, and multiple year averages noted above.

Multiple-year averages are calculated using only those firms that are in the database for all the years used in the multi-year average. Co-ops are identified only by an identification number in the two separate databases, making it difficult to match the data with specific co-ops. Therefore, we cannot identify each co-op's financial information over the entire range of years, 1980-2005.

## Internal Performance Factors

A recent Harvard University study identified eight factors that lead to high business performance. These factors provide a useful framework for categorizing the philosophy and practices of MMC. The study, published in the Harvard Business Review in July 2003, was entitled "What Really Works." The authors (Nohnia, et al.) evaluated 200 different management practices in 160 different companies over a 10 year period. Their primary conclusions are that business basics matter and that successful businesses generally follow a " $4+2$ " formula for success. The first four are primary practices that virtually all successful companies excelled at. They are practices related to strategy, execution, culture and structure. The second four are secondary practices and successful companies excelled in at least two of the four. They are practices related to talent, innovation, leadership and external relationships, including mergers and partnerships. A brief description of each practice is provided along with some information about how MMC views their behavior related to the practice.

Strategy. Strategy involves the formation of a vision and mission by the leadership team as well as the creation of additional more specific strategies. The Harvard study found that the most important practice was the communication of a clear and obvious value proposition to the customer.

MMC has expressed the broadest view of their strategy in three types of statements: a vision, a mission and a motto. Their vision is "To be the first choice of our customers and our employees." Their mission is "To profitably provide quality products and services that help our customers succeed." Their motto is "Your business is our business." The primary guiding philosophy of the organization, as stated by the CEO, Vance Westhusin, is "We live the vision. Everything we do connects to our vision." As farm programs changed and producers shifted to more acres in fall crops and fewer in wheat, including less summer fallow, MMC decided to shift with their customers by shifting the agronomy operations to serve the needs of their customers. They moved to grow the business in both grain and agronomy by investing in a higher service agronomy business that included more assets and people to provide application and other services.

MMC's operational strategy, as stated by their CEO, is ... "to have good people but to work the assets and people hard. For example, instead of covering 20,000 acres per year per RoGator application unit we try to get 40,000 acres. We can afford more machines, I just don't want more." In terms of day-to-day supervisory philosophy, their CEO says, "I try to know as much as possible, every day, on all parts of the business. I see all the mail and approve all the bills and payments. All purchases over $\$ 50$ need my prior approval. All complaints by customers or employees have to be documented within 24 hours of their occurrence. I don’t like surprises. But as we've gotten bigger it is harder to keep track of everything."

MMC's marketing strategy with respect to pricing is to be competitive. As their CEO observes, "We don't try to have the best price or the worst price. People tell me we are usually the price leader."

MMC's asset investment strategy is to be very frugal. Asset utilization or turnover ratios are expected to be very high. As noted in the section on past performance, the average efficiency ratio, sales to net fixed assets, for 1999-2004 was 15.32 placing MMC in the $96^{\text {th }}$ percentile on net fixed asset utilization or turnover. This compares to the typical or $50^{\text {th }}$ percentile ratio of 7.53. Vance Westhusin expressed his philosophy this way: "I want fewer assets than I really need."

Execution. Execution requires a company to align on its primary strategies and to be disciplined enough to implement those strategies including accomplishing its value proposition to customers and implementing its operating philosophy. The Harvard study found that the most important practice was to delegate to the lowest level possible. In general, the keys to execution are to (1) follow a strategy that aligns on customers, (2) manage people in a way that aligns people with customers and strategy, and (3) manage operations by aligning assets and processes with customers, strategy and people.

MMC aligns its operations on its vision and mission, especially its customers, its employees and its company profitability. As Vance says, "We are disciplined on the followthrough. We execute."

Culture. Each company has a culture that is influenced by many factors, many of them external and out of the control of the company. The Harvard study found that the most important cultural practice under the control of the company was to create a climate of high expectations.

Vance has high expectations of himself and the employees. He admits, "I expect our employees to do more with less, such as with our agronomy application equipment. And I don't want to give things away. Also, I push the idea of ‘No mistakes.' Mistakes really irritate me and our people know that."

Structure. Structure is related to organizational structure and the relationships and processes of how people work and communicate within the organization. The Harvard study found that simple structures were best in combination with open and sharing communication. The study also found that the best people should be close to the action. This implies a very flat organizational structure in which the CEO and other supervisors tend to have a relatively large number of people reporting to them in combination with the employment of fewer but relatively talented people so that delegation can be made to the lowest level possible, as suggested by the execution factor findings.

MMC is viewed by its CEO as a company with a flexible, changing structure. Today there are 45 employees and the CEO has 7 direct reports. Three are area managers over operations, and the others are department managers including crop production, grain merchandising with significant strategy input from the CEO, office management including accounting and maintenance management. Employees are generally assigned to locations and the various departments are expected to share those employees in a flexible, effective way.

Talent. The talent factor looks at the quantity and quality of people employed by the company but can also include the use of contractual services from outside suppliers of talent. The Harvard study found that the most important practice was to recruit the best people possible and to train and develop people.

MMC's strategy has been to hire the best people available at the entry level, to retain them by helping them grow and develop and to reward performance, according to their CEO. It is getting harder to recruit and retain employees, especially at the more rural locations. Overall, turnover is expected to be about 20 percent annually or around 10 employees each year from all levels combined. In 2005 MMC hired nine new employees and has hired 25 new people in the last five years. There is good stability at the department manager level. The years of tenure of the seven direct reports are: Three area managers, 1, 5 and 27; crop production, 14; grain merchandising, 2 ; office manager, 7 ; and maintenance manager, 20 . This is an average of about 11 years.

Innovation. Innovation includes developing new products and services as well as creating new and better ways of doing things. The Harvard study found that the most important
practices were to develop new products and new methods as well as to anticipate and prepare for disruptive events. Most local co-ops do not focus on developing new products and services although they do focus on adding new products and services that are desired by customers.

MMC focuses on trying to anticipate employee turnover and having people trained to take over when needed. Cross-training is used as much as possible to minimize hiring of extra people that may not be fully utilized.

Leadership. The leadership factor focuses on the selection and development of directors as individuals and the functioning of the board as a policy making unit and the selection of the CEO as well as the relationship between the board and CEO. The Harvard study found that the most important practices were to select a great CEO, to link pay and performance and to choose directors who have a stake in the company. For a cooperative, the challenge in director selection is to be successful in getting the most talented and capable members to stand for election and get elected.

The current board chairperson, Kent Stamper, has served on the board for a total of 26 years, longer that any other sitting director. His service has been broken into two segments, 1976-88, and 1992-2006. He has also served as a director on two different regional cooperative boards, Union Equity and Farmland Industries. During his 26 years of service he has been elected by the board to serve as the chief board officer (president, chairman or chairperson) for a total of 20 years, not all of them contiguous.

Kent believes the foundation for MMC's success has been an outstanding board and their ability to hire and retain a high performing CEO. The board has established a compensation system that links CEO pay with performance. And they have maintained a very close working relationship with the CEO that focuses primarily on strategic issues. As Kent notes, "We believe in the strategic planning part of our responsibilities. We look at issues in a 3 to 5 year time frame and try to understand what will impact the membership and the co-op in the future. We do not spend a lot of time discussing past history and past numbers. And we believe our CEO executes our business plan very well."

A major strategic focus by the board has been on building a strong board with very capable directors. Kent describes their strategy as having four components: recruitment, retention, education and expected participation and support. In terms of recruitment, MMC uses a nominating committee that aggressively looks for good candidates and describes the high expectations they have for directors. As was noted in the previous section on leadership by management and the board, MMC started an associate director program in 2003 and now has its first elected director as a previous participant in that program. In terms of retention, the co-op does not have term limits. Education and development of directors is strongly encouraged. Their policy is that new directors must attend the complete the Kansas Cooperative Council’s four course Director Development Program and all directors are encouraged to attend other important industry meetings as a way of improving themselves.

Perhaps the biggest on-going focus for the board is to stress participation in board activities and stress supporting the co-op with not only their time but their business. Kent said, "We have annual board retreats for 2-3 days and we have monthly board meetings. Attendance at these meetings is required." And they stress that directors should do as much business as possible with the co-op. According to Kent, "We have only had one director in my 26 years on the board that I remember we ever had to visit with about supporting the co-op with their farm business."

The board is careful to build strong support for major strategic decisions before moving ahead. In looking back, Kent said they have developed a working philosophy on decision
making. "We have found if there is not a strong majority supporting a strategy we just don't do it. We generally get a unanimous vote on key issues but if we don't get strong support we wait and rethink the strategy."

The board is very aware of MMC's past success but they are always looking at new possibilities to improve. They value their customers as reflected in their vision statement and they pay attention to customer requests, according to their board chairperson. The board and CEO believe in retaining good employees.

The CEO reports that pay is linked to performance for the CEO and for the employees, a policy supported by the board for all employees and a policy directly implemented by the board in the case of the CEO's compensation. However, Vance Westhusin sees pay to the CEO as broader than financial compensation. He stated, "I don't see my financial pay as a major issue. The biggest factor for me is board support and dedication."

With respect to employee pay, the CEO says MMC tries to be competitive on wages but expects high performance. Bonuses are paid to employees. But performance is also measured in terms of the personnel costs as a percent of gross income with a target of being below 40 percent (or a gross income to personnel cost ratio of 2.5 or higher). As noted in the previous section on past performance, the gross income to personnel cost ratio averaged 2.81 for the years 19992004, putting MMC at the $87^{\text {th }}$ percentile. A strong effort is made to keep personnel costs low. Wages of frontline people are based on the local market. Department manager compensation is based more on the broader agribusiness market for comparable skills. According to the CEO, MMC is about in the middle of the pack to the top one-fourth for compensation for the department manager people, given the company's size, based on the CHS/LOL Member Services compensation survey information.

External relationships. External relationships range from ownership in other businesses such as regional co-ops and joint ventures that are suppliers and buyers, to contractual or open market, buy-sell business with producer-customers, suppliers like Agriliance and CHS-Cenex, and buyers like DeBruce Grain or Scoular Company, to communication with neighboring competitors, including other similar cooperative and independent ("investor-oriented") retail businesses. The Harvard study found that two important practices, when considering mergers or other partnerships, was the ability to leverage existing customer relationships with business partners, and to build on the strengths of the partners when forming any kind of formal business relationship.

MMC is an investor in and customer of several regional co-ops including CHS, Land O’Lakes, Midwest Energy and FCStone (Farmers Commodity Corporation), as are most local co-ops in the Midwestern States. MMC is also an investor in other joint venture companies, formed as LLCs. The primary one is their 30 percent ownership of Westland Terminal LLC, a joint venture company that owns the grain train loader at Ogallah. In turn, Westland is part of the Castle Rock Marketing joint venture with Cargill that operates the Ogallah and Wakeeney train loaders.

MMC has been very active in participating in various joint ventures in their area that are related to their primary business lines of grain, agronomy and petroleum. As is the case with many local co-op investments in joint ventures, the results have been mixed. Also, the CEO has focused a lot of time in developing relationships with other stakeholders in the industry.

## Discussion Questions

1. Why do you think Midland Marketing Co-op is so profitable? List up to five reasons (or factors) and then rank them.
2. What changes in strategy do you think Midland Marketing Co-op could make to improve performance? List up to three changes and rank them.
3. Given what you've learned about Midland Marketing Co-op and what you know about other high performance co-ops or other businesses, what changes can your co-op make (or coops in general make) to improve performance? List up to three changes and rank them.
