INTRODUCTION

The determination of the value of timber as evidenced by sales of standing timber and logs is one of the most essential factors in the calculation of returns from forest properties, and is of especial interest during periods of general economic depression. Although many of the benefits of forests to the greatest number of people can not be accurately measured in dollars and cents, yet, in the last analysis, forestry as a private business enterprise must show sufficient monetary returns to justify the expenditures. Data on stumpage and log prices compiled for a number of years and correlated with pertinent economic conditions, may well establish price trends that will be of great benefit in showing to timber growers actual and possible returns which they may count on. Through the cooperation of the Bureau of the Census

of the Department of Commerce, the division of forest economics has for several years been collecting and compiling such data. Although the period of years thus far covered is too brief to permit of adequate comparisons and conclusions the annual record is in itself of interest and value to alert timber owners.

The record for the calendar year 1930, following those for 1928 and 1929, already published as Statistical Bulletins 32 and 36, was compiled from compilations on private stumpage and log transactions obtained from a large number of representative reports. Although it is unavoidably fragmentary for some States and species, the fact that it is based on 4,670 sales of stumpage, involving over 7,250,000,000 feet of timber in 44 States, and 5,647 sales of logs involving more than 7,600,000,000 feet of timber in 39 States,<sup>1</sup> gives the resultant tabulations a considerable stability.

Stumpage and log prices, as used in this bulletin, represent the monetary consideration for which the ownership of standing timber in the woods, or logs f. o. b. the manufacturing plant, changed hands. All prices per thousand feet are weighted; that is, their relative importance in species, State, or regional averages is determined by the quantity.

So many different factors are involved in the determination of stumpage and log prices that the values given are indicative only and can not be applied to any specific tract. The range between the minimum and maximum prices for each species shows in itself that many factors enter into stumpage and log prices. The selling price of standing timber follows in a general way the same trends as the prices of lumber and other wood products. For individual transactions, however, the price paid for standing timber depends, among other things, on the species, quality, size, and density of the timber; the quantity sold and whether for immediate or future cutting; the quantity of other timber available, and the competitive demand for the timber; the kind of product to be manufactured from it; the location with respect to manufacturing plants, transportation facilities, and markets; the cost of exploitation as determined by local conditions with respect to topography and surface, labor, cost of equipment and supplies, etc.; the form of sale (lump sum, flat rate per thousand feet, specific rate for different kinds of timber, etc.); the terms of sale, including provisions as to time and rate of payment, method of cutting, requirements as to fire protection, brush disposal, utilization, etc., and provisions regarding taxes; and finally the desire of the purchaser to buy and the seller to sell, and the knowledge of values on the part of each. With logs, also, the price received depends to a large degree upon the conditions involved in the particular transaction. Of the factors influencing the selling price of standing timber and logs, competition between purchasers and the knowledge of values on the part of both purchaser and seller exert a very great influence.

Sales of both stumpage and logs have been classified into two main groups as follows: (1) Individual sales, which include sales of only one species or of several species where each was sold at an individual price instead of being grouped with other species for a lump sum or at a uniform rate per thousand feet; (2) flat-rate sales, in which two or

<sup>1</sup> No reports of sales of logs were received from Arizona, Colorado, Nevada, New Mexico, and Wyoming; and no reports of sales of stumpage or logs were received from Nebraska, North Dakota, South Dakota, or Utah.

more species were grouped together and sold for a lump sum or at a uniform rate or where one species was sold under a group name, such as pine, and could not be accurately identified. In compiling flat-rate sales no accounting has been made of the different species involved, since the price paid for each could not be definitely or satisfactorily determined. Flat-rate and individual sales have been combined, however, into State and regional averages for softwoods, hardwoods, and all species, for these total averages indicate the average selling price of all species of standing timber and logs in the several States and regions.

It is interesting to note that 38 per cent by volume of the stumppage transactions and 8 per cent by volume of the log transactions were flat-rate sales. (Table 1.) In the case of both hardwoods and softwoods, much higher prices were paid for all kinds of timber and logs when these were sold individually. The difference between the 38 per cent of flat-rate stumppage sales and the 8 per cent of flat-rate log sales is accounted for by the fact that logs are the first step in the conversion of standing timber into definite forest products. Although there are no definite and well-established log markets of any great consequence except in the Douglas fir region of Washington and Oregon, the conditions under which logs are sold are fairly uniform, the price level of logs varying with the kind and quality of logs sold, along with several other factors such as the competitive field existing and the distance to manufacturing plants. On the other hand, there is no fairly well-established stumppage market and sales of stumppage for a lump sum are much more common than similar sales of logs.

While it is probably true that more of the higher grade stumppage and logs were sold individually (by species) and that the poorer were more likely to be grouped together and sold collectively, yet there is a fundamental principle of merchandising involved in the sale of standing timber and logs which also applies to the sale of any other raw material or commodity. When all other factors have been given due consideration, the vendor of standing timber or logs will be more apt to receive the true value of his merchandise if he takes a careful inventory of the different kinds of material which he has for sale and markets them as individual parts of a transaction rather than in one lot. Flat-rate sales of stumppage or logs by the Government or by large timber-holding corporations are practically, if not entirely, unknown, and it is becoming more and more common even for farmers to cut their own timber and dispose of the logs to a manufacturing concern at individual prices for the different kinds.

According to Table 1, 87 per cent of the standing timber reported sold in 1930 was softwoods; 6 per cent was hardwoods; and the remainder was mixed hardwoods and softwoods sold in flat-rate sales. Approximately 44 per cent of the softwoods was Douglas fir; 13 per cent was western yellow pine; 11 per cent was shortleaf pine;<sup>2</sup> and the remainder was distributed among the various species, with western hemlock, sugar pine, and western red cedar each comprising a relatively large proportion. While these data can not be considered as giving the total stumppage sales in 1930, they undoubtedly give a representative cross section of the timber sold in that year, and it is reasonable to assume that the greater part of the volume sold would

<sup>2</sup> Individual sales of shortleaf pine only. Does not include sales of southern yellow pine where the species could not be accurately determined.

be virgin timber. Similarly 90 per cent of the log sales reported involved softwoods, about 8 per cent involved hardwoods, and the remainder were flat-rate sales of hardwoods and softwoods combined.

Table 2 gives the amount of all stumpage and logs sold as reported by States, with the percentage of the total for each State for 1929 and 1930. In 1929 sales involving nearly 16,000,000,000 feet of stumpage and more than 8,500,000,000 feet of logs were reported. In 1930 similar reports involved about 7,250,000,000 feet of stumpage and 7,600,000,000 feet of logs, although the number of reports of both stumpage and log transactions had increased. The greatest volume of stumpage sold in 1930 was in virgin stands on the Pacific coast. California, Oregon, and Washington reported a total of 72.46 per cent of all stumpage sold in 1930, as against 76.84 per cent in 1929, considerable changes in percentages being evident in Oregon and California. Among other States the shift in proportionate amounts between the two years was generally small. As evidenced by the reports received, stumpage transactions, especially during the latter part of 1930, were conducted, generally speaking, on a hand-to-mouth basis. Particularly in the East and South operators appeared to be buying standing timber for immediate exploitation only. The average stumpage sale in 1929 was of about 3,700,000 feet. In 1930 the average was about 1,500,000 feet. Uncertainty as to the future conditions, as well as the unsatisfactory current condition of the market for wood products, were probably the most important reasons why the quantity of standing timber sold for future exploitation in 1930 was relatively small. Similarly the volume of log sales was reduced in 1930 as compared to 1929, the reports received showing that the greater part of the reduction occurred during the last six months of the calendar year.

Tables 3 to 11, inclusive, give by States the average stumpage and log sale prices of individual species of all softwoods and hardwoods; flat-rate sales of softwoods, hardwoods, and mixed woods; and State averages. The 1930 reports seem to indicate, as in previous years, that other things being equal, the price of standing timber and logs increases in direct ratio to the nearness to the centers of largest consumption of wood products. While western yellow pine stumpage, largely from virgin stands, was bringing an average of \$3.34 per thousand feet in the far West, northern white pine stumpage, largely from second-growth stands, was bringing an average of \$8.30 per thousand feet in the Lake States and Northeast. A few sales of redwood showed an average price of \$2.51 a thousand feet and of cypress \$6.49. The average stumpage price per thousand feet of all standing timber reported sold in 1930, in the most important timber-producing regions (fig. 1 and Table 12), was as follows: Northeastern, \$7.29; North Atlantic, \$6.06; Lake, \$5.27; Central, \$6.49; North Carolina pine, \$4.85; southern pine, \$4.30; Pacific Northwest, \$2.61; Pacific south, \$2.77; Rocky Mountain north, \$2.09; and Rocky Mountain south, \$2.72. Although a decline in stumpage and log prices was noted in 1930 as compared to 1929, prices remained proportionately higher in those regions geographically nearer the big centers of population. The aggregate average price paid for second-growth timber (Table 10) is higher than the average price of all timber. This is because the second-growth timber is more consistently accessible to market.

In Tables 3 to 11 sales of individual species in the several States have been shown separately in each type of sale and averaged for each type; the price range (from minimum to maximum) has also

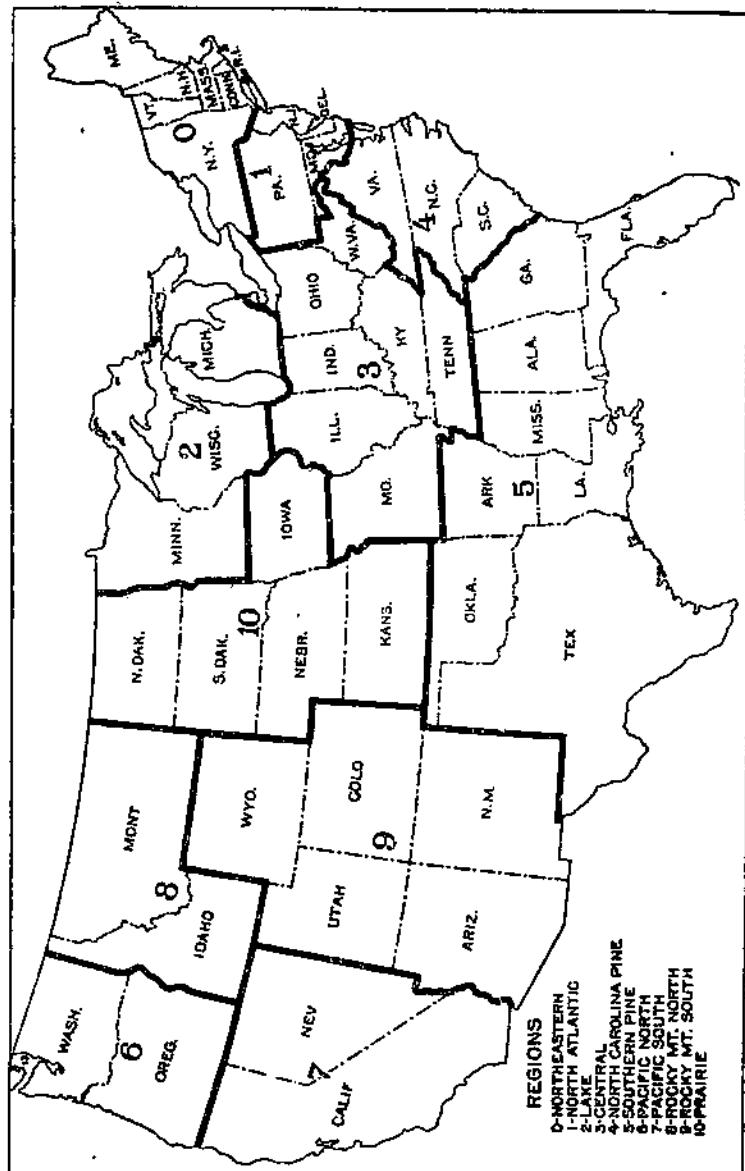

FIGURE 1.—Stumpage and log regions in the United States

been given. Because in the future, in computing costs and returns, the prices of second-growth timber will probably be used, the average selling price per thousand feet for second-growth timber has also been given. Similarly, because the greatest part of all the logs produced is manufactured primarily into lumber, the average selling

price of lumber logs has been given for individual species and for each type of sale, as well as the average price and the price range for all log sales.

A regional recapitulation of the stumpage and log price data given in these Tables is set forth by species, type of sale, and regions in Table 12. This tabulation gives in some instances a clearer picture of conditions than it is possible to obtain through consideration and analysis of the data for any one State, since the returns for some States are unavoidably fragmentary, whereas regional averages of species, being based on a greater number of transactions, are more consistently representative.

As stated already, a great many conditions enter into the prices realized for standing timber and logs. An analysis of the 1930 data shows that the extremely low and high prices, as indicated by the price range, were effective in a relatively small proportion of the reported transactions and contributed a small part of the total volumes involved. In many cases the largest number of transactions, involving the greatest amount of timber, fell within the same price-range class of the general average. Frequency of price-range classes has been tabulated by species and types of sale in Table 13. Fifty-six per cent by volume of the stumpage was sold at prices between \$2 and \$5 per thousand feet.

Table 14 gives an analysis of the different species and types of sale by virgin, second-growth, and mixed or culled virgin stands. There are probably some inaccuracies in the reports on which this table is based, as indicated by table footnotes. However, even when proper allowance is made for these, the relative quantity of second-growth timber sold in 1930 (17 per cent) is surprisingly small.

A complete return of the sales of logs in the United States in any one year is practically impossible to obtain owing to the varied conditions under which logs are sold. The west coast of Washington and Oregon has well-defined and established log markets. In other parts of the country are a few small and very much localized markets, which, however, handle only an insignificant part of the logs sold. Elsewhere log markets are unorganized and scattered. In spite of the incompleteness of the returns, however, it is reasonable to assume that the reported log transactions form an adequate basis for general conclusions.

Reports indicate (Table 15) that about 83 per cent of the logs purchased or sold in 1930 were intended primarily for the production of lumber. This should be of some significance in determining objectives in the management of forest lands.

The general average for all privately owned standing timber sold in 1929, computed from data obtained and analyzed in exactly the same manner as the 1930 tabulations presented herewith, was \$3.64 per thousand feet. The corresponding average of all sales for 1930 is \$3.25. The average selling price of all logs per thousand feet board measure in 1929 was \$17.08 and in 1930 is \$15.03. The apparent reduction of \$0.39 for stumpage and \$2.05 for log prices can not be accepted as conclusive evidence of the extent of the downward trend in prices, for many factors enter into these general averages which are not disclosed by the bare figures themselves.

A comparison between the 1929 and 1930 general average prices should be based on as nearly identical transactions as possible. If

the 1930 average stumpage and log prices are computed on a basis of the 1930 rates for the different species and on a basis of the percentages which the different species formed of the total sales reported in 1929, the average prices for the two years will be based on total amounts composed of the same percentages of the different species, and the main cause of dissimilarity between the two years will be removed. This method would not be as accurate in the case of two widely separated years, but it is not illogical to assume that the other most important factors which determine stumpage and log prices will not greatly vary in two consecutive years if the averages are based on the same proportionate amounts of the different species.

Computing the general 1930 average stumpage and log prices on the basis just described, the average stumpage price was \$3.15 and the average log price was \$15.32 per thousand feet in 1930, or a decrease from 1929 of \$0.49 (13.5 per cent) per thousand in stumpage prices and \$1.76 (10.3 per cent) in log prices. In this connection brief but representative comparisons between 1929 and 1930 lumber prices are pertinent. If prices for the year 1926, as a base, are given a weight of 100 per cent, the wholesale price of all building materials, as compiled by the Bureau of Labor Statistics of the Department of Labor is 97.1 in 1929, and 90.3 in 1930, a decrease of 7 per cent in one year. The average wholesale price of 12 representative lumber items in 1929, as compiled by the same bureau, is \$40.80. In 1930 the same items average \$37.63, a decrease of \$3.17 (7.8 per cent) per thousand feet in 1930 over 1929.<sup>3</sup>

Prices paid by contractors for building materials delivered on the job for six representative lumber items<sup>4</sup> in eight representative cities,<sup>5</sup> as compiled by the Division of Building and Housing, Bureau of Standards, Department of Commerce, from information obtained through the Bureau of the Census, show reductions varying in extent in the several cities and yielding a general average reduction for 1930 of \$2.30 per thousand feet board measure (4.4 per cent) from the 1929 level.

The selling price of lumber of all widths, as compiled by the regional office of the United States Forest Service, Missoula, Mont., from data furnished by the lumbermen's information bureau of the Western Pine Manufacturers Association, shows the following decreases in 1930 over 1929: Idaho white pine, \$0.77; western yellow pine, \$4.53; Douglas fir and larch, \$2.97; Engelmann spruce, \$2.30; white fir, \$4.60; and cedar, \$2.98. The net lumber returns per thousand feet to lumber manufacturing members of the West Coast Lumbermen's Association, according to data furnished by its members, decreased \$2.97 in 1930 over 1929.

<sup>3</sup> Items included: Cypress, shiplap, at St. Louis; Douglas fir, common sheathing and drop siding at mills; plain red gum, at St. Louis; northern hemlock No. 1 at Chicago; hard maple No. 1 at Chicago; white oak, plain No. 1 common, at Cincinnati; white pine No. 2 at Buffalo; yellow pine flooring at mills; yellow pine timbers at mills; yellow poplar No. 1 at Cincinnati; and eastern spruce at Boston.

<sup>4</sup> Yellow pine No. 1, 2 by 4 inches by 16 feet SISIE; Douglas fir No. 1, 2 by 4 inches by 16 feet SISIE; North Carolina pine No. 1, 2 by 4 inches by 16 feet SISIE; common boards 1 by 6 inches; yellow pine flooring, edge grain, "C," 1 by 4 inches by 10 to 16 feet; Douglas fir flooring, V. G. No. 2, 1 by 4 inches by 10 to 16 feet.

<sup>5</sup> Paterson, Akron, Philadelphia, Baltimore, Milwaukee, St. Louis, Los Angeles, and Birmingham.

<sup>1</sup> The timber has been classified as reported by cooperators. In some instances species such as aspen and jack pine, although they are second growth in the strict sense of the word, have been reported as virgin because the stands have not been logged. In the far West small virgin timber is commonly called second growth and has been so reported.

<sup>2</sup> Less than 0.5 per cent.

## APPENDIX

## REGIONAL STUMPAGE AND LOG PRICES IN WASHINGTON AND OREGON, 1930

The largest and heaviest stands of virgin timber in the United States are in Washington and Oregon. It is to be expected that the stumpage and log transactions reported from these States in 1930 would involve a relatively large volume

FIGURE 2.—Stumpage regions in Washington and Oregon

of timber. Because of widely differing conditions within these two States, with regard both to timber stands and log markets, a separate analysis of the data from these States is justified.

Washington has two main timber regions of great dissimilarity, namely, eastern Washington and western Washington, the dividing line being roughly the crest of the Cascade Mountains. (Fig. 2.) Silvicultural conditions, principal species

of trees, methods of logging, and other important factors having a direct influence on stumpage prices vary greatly between the two regions. The average stands of timber are considerably heavier in western Washington than they are in eastern Washington. Douglas fir is the principal and, generally speaking, one of the

most desirable species of timber in western Washington, whereas in eastern Washington it is considered one of the inferior and less desirable species. The average stumpage prices reported in 1930 for Douglas fir were \$3.19 in western Washington and \$1.32 in eastern Washington.

Similarly, Oregon has three main timber regions: Eastern Oregon and western Oregon, the dividing line again being the Cascades, and the four south-central

## 54 STATISTICAL BULLETIN 37, U. S. DEPT. OF AGRICULTURE

counties (the Klamath region) which are similar in timber characteristics to northern California. Western Oregon has the heaviest stands of timber and eastern Oregon the lightest, and the Klamath region stands are between the two extremes. For reasons similar to those given for Washington, the average reported stumpage price of Douglas fir in western Oregon was \$2.27; in eastern Oregon, \$0.77; and in the Klamath region, \$0.54.

Washington has five natural regional log markets, as shown by Figure 3. The eastern Washington stumpage and log regions are geographically exactly the same; western Washington has, however, four log markets, i. e., Puget Sound, Grays Harbor, Willapa Harbor, and the Columbia River. There is at least as much dissimilarity between eastern and western Washington log markets as there is between the same stumpage regions.

Similarly the eastern Oregon and the Klamath log regions are identical, geographically, with the stumpage regions, whereas western Oregon has two natural log regions, the four western counties bordering on the Columbia River constituting the Columbia River log region, as distinct from the remainder of western Oregon.

In eastern Washington, eastern Oregon, and the Klamath regions there are, generally speaking, no standard log grades, and most of the logs are produced by concerns who also manufacture them into lumber or other products. In western Washington and Oregon a considerable quantity of the total logs are produced by independent logging concerns, and the majority of these logs are sold on a basis of a grade and scale which is determined by employees of log scaling and grading bureaus. Generally speaking, log grades and methods of scaling are fundamentally the same throughout western Washington and Oregon. There is more or less competition between log consumers in some of the regions and between consumers in the several regions. It is entirely possible that competition for logs between the several regions will become more acute in the future.

Tables 16 to 19 give average 1930 stumpage and log prices as indicated by reports received for Washington and Oregon and for the several regions, species, and type of sale. All averages are weighted, and all log prices are camp run.
