GRADE, STAPLE LENGTH, AND TENDERABILITY OF COTTON IN THE UNITED STATES

1928-29 TO 1934-35

*Prepared in the Bureau of Agricultural Economics
In cooperation with State Agricultural Agencies*

MAR 31 1937

STATEMENT OF COOPERATION

In assembling the information on which this report is based, the following agencies cooperated during each of the 7 years covered by the data:

Arizona Agricultural Experiment Station.
California State Department of Agriculture.
Georgia Experiment Station of the University System.
North Carolina Agricultural Experiment Station.
Oklahoma Agricultural Experiment Station.
South Carolina Agricultural Experiment Station.
Tennessee Agricultural Experiment Station.

In addition, the following agencies cooperated during some part of the 7-year period:

Alabama Agricultural Experiment Station.
Arkansas Agricultural Experiment Station.
Florida Agricultural Experiment Station.
Louisiana Agricultural Experiment Station.
Mississippi Agricultural Experiment Station.
Missouri Agricultural Experiment Station.
New Mexico Agricultural Experiment Station.
Texas Agricultural Experiment Station.

INTRODUCTION

Among the characteristics of cotton lint that determine its usefulness and desirability for manufacturing purposes are grade and length of staple.

Grade is a term denoting the composite of (1) the color, luster, and brightness of the lint; (2) the nature and quantity of foreign material present, such as sand or dust, or particles of leaves, bark of stalks, shale, etc.; and (3) preparation, or ginning. A white cotton is usually preferred, and a high degree of luster and brightness is desired by manufacturers of some classes of products.

Cotton is commonly referred to as being short, medium, or long with respect to staple length. Short cotton is sometimes considered as that which is $2\frac{1}{2}$ inch or less in length of staple; medium, that which ranges from $1\frac{1}{2}$ inch up to and including $1\frac{3}{4}$ inches; and long

¹ By W. B. Lamham, F. H. Harper, Sam W. Martin, F. E. Nelson, C. C. McWhorter, and G. E. Miller. Credit is due Carl H. Robinson for general supervision; Arthur W. Palmer for helpful suggestions; cooperating State agencies, and the cotton ginners, warehousemen, dealers, manufacturers, and owners of cotton whose cooperation has made this report possible.

cotton, that which has a staple length of $1\frac{1}{2}$ inches or more. Cotton of the longer staples is expected to sell for higher prices, other conditions being equal, than cotton of the shorter staples, and growers frequently find it advantageous to produce such cotton.

Character of cotton also is related to its usefulness and desirability for manufacturing purposes. The term "character" is used to designate those elements of quality not described or indicated by grade and staple-length classifications. There are no established official standards for character, and therefore the data herein presented include no information on this element of quality. The United States Department of Agriculture recognizes the need for such standards, however, and a comprehensive program of research is being conducted in the Division of Cotton Marketing for the purpose of studying character of cotton in its relation to spinning value.

Under the authority of legislation enacted in 1927 (act of Mar. 3, 44 Stat. 1372-1374), the Division of Cotton Marketing has prepared periodic reports during the ginning season, beginning in 1928, on the grade, staple length, and tenderability of cotton ginned during specified periods in the individual States and in the United States as a whole and has issued a report on the entire crop after the end of each ginning season. In addition, a report has been prepared and issued each year since 1928 on the grade, staple length, and tenderability of cotton on hand in the United States on August 1.

The Division conducted preliminary work of this nature during the 1927-28 season, but it was of restricted scope, having reference only to the State of Georgia and a Texas-Oklahoma area of 27 counties. The results of this study were published in Statistical Bulletin 40, tables 31 and 32, the counties included in the Texas-Oklahoma area being listed in footnote 1 of table 32. It was in 1918, however, that the Department of Agriculture made its first attempt to assemble information on the quality of cotton stocks on hand. On June 7 of that year the Cotton Division of the Bureau of Markets sent telegrams to exchanges or firms in 50 principal cotton centers in the South asking for the number of bales of each grade of cotton in storage not sold to consumers. On June 15, 1918, questionnaires asking for information on the grade of cotton stocks were sent to dealers, manufacturers, and warehousemen. Information received in response to both inquiries was summarized in the Bureau of Markets, but it was not published. (The Bureau of Markets was combined with the Bureau of Crop Estimates in 1921 to form the Bureau of Markets and Crop Estimates, and this latter Bureau was combined with the Office of Farm Management and Farm Economics in 1922 to form the Bureau of Agricultural Economics.)

These reports on the crop and carry-over contain figures showing the number of bales of cotton recognized as being tenderable on contracts for future delivery under section 5 of the United States Cotton Futures Act of August 11, 1916, as amended, and the number of bales of cotton that are untenderable. Included in the latter is all cotton shorter than seven-eighths of an inch in staple, irrespective of grade, and cotton of certain of the lower grades in the various color groups, irrespective of staple length. Table I lists the standards for grade for American upland cotton in effect at the time the classifications reported upon in this bulletin were made. New standards for grade became effective on August 20, 1936.

The new grade standards are the result of efforts covering nearly a quarter of a century in the interest of more efficient and orderly marketing of cotton. The original United States Cotton Futures Act was approved on August 18, 1914. This statute was declared unconstitutional by the United States District Court for the Southern District of New York for the reason that in form the act was a revenue-raising measure and had originated in the Senate rather than in the House of Representatives. The constitutional question involved was not decided by an appellate court, but a reenactment of the statute with certain modifications was approved on August 11, 1916. Acting under authority contained in the original statute, the Secretary of Agriculture, on December 15, 1914, issued orders promulgating a set of standards for nine White grades, which replaced the entire set of nine permissive official standards for the White grades set up in 1909. Other grades were added later, and the standards have been revised from time to time. The first order establishing official standards for length of staple was signed on October 25, 1918.

In the revision of the grade standards for upland cotton which was promulgated in 1935, effective August 20, 1936, the grades for Blue Stained and Light Yellow Stained cotton were eliminated, and the grades for Yellow Stained were made descriptive. The grades for White cotton were shifted to include whiter color, and the more creamy samples in the higher grades for White cotton were eliminated, since creamy cotton could not be found in quantities sufficient to make copies of the old standards. The highest grade for White cotton, No. 1 or Middling Fair, was made descriptive, as were the grades for Extra White. The latter were increased in number from 5 to 7. The new grades for Tinged cotton do not contain the deeper colored cottons of the old series, and the changes in the White and in the Tinged standards resulted in excluding from the descriptive standards for Spotted cotton much of the Light Tinged cotton heretofore classified as Spotted. No. 2 Yellow Tinged (or Strict Good Middling Yellow Tinged) was eliminated in the revision. The revision thus provided for a reduction in the number of grades from 37 to 32, and a reduction in the number of standards represented by grade boxes from 25 to 13. It should be pointed out, however, that all of the figures presented in this publication are based upon classifications according to the official standards in use prior to August 20, 1936. For the revised standards effective August 20, 1936, physical standards have been prepared for the grades Strict Good Middling, Good Middling, Strict Middling, Middling, Strict Low Middling, Low Middling, Strict Good Ordinary, and Good Ordinary of the White color group and for the grades Good Middling, Strict Middling, Middling, Strict Low Middling, and Low Middling of the Tinged color group. All other grades of these revised standards are descriptive and are not represented in physical form.

Physical forms of the standards for grade listed in table 1 were prepared for all grades of American upland cotton except those of the Spotted, Light Yellow Stained, and Gray color groups and the grade Strict Good Middling of the Yellow Tinged color group. For these grades descriptive standards only were set up. All of the physical and descriptive standards for grade of upland cotton, with the exception of those for Extra White, are known as the Universal Standards for grade of American upland cotton, in accordance with the universal

standards agreements between the United States Department of Agriculture and the nine leading cotton organizations of Europe, as follows:

- Liverpool Cotton Association, Ltd., Liverpool, England.
- Manchester Cotton Association, Ltd., Manchester, England.
- Federation of Master Cotton Spinners' Associations, Ltd., Manchester, England.
- Syndicat du Commerce des Cotonns au Havre, Havre, France.
- Bremmer Baumwollbörsse, Bremen, Germany.
- Associazione Italiana Fascista degli Industriali Cotonieri, Milan, Italy.
- Centro Algodonero de Barcelona, Barcelona, Spain.
- Marché de Coton à Gand, Ghent, Belgium.
- Vereniging voor den Katoenhandel te Rotterdam, Rotterdam, Netherlands.

The universal standards do not apply to the standards for length of staple.

In the case of American-Egyptian cotton, for which there are nine established grades, physical standards have been prepared for the five "even" grades—No. 1, No. 2, No. 3, No. 4, and No. 5—whereas for the four half grades—No. 1½, No. 2½, No. 3½, and No. 4½—and for cotton not described by any of the established classifications, referred to as "below grade No. 5", descriptive standards only are used. Descriptive standards for grade have the same legal status as grades represented in physical form.

¹ The grades shown above the heavy black line are deliverable on futures contracts made in accordance with sec. 5 of the United States Cotton Futures Act. Those below the line are untenderable on such contracts. These standards were superseded by revised grade standards effective Aug. 20, 1936.

The last complete revision of the staple standards became effective August 1, 1929. Issuance of staple types for additional lengths, $\frac{13}{16}$, $\frac{29}{32}$, and $\frac{31}{32}$ inch, was authorized July 30, 1932, officially effective August 1, 1933. The standards in physical form include American upland cotton of the lengths $\frac{7}{8}$, $\frac{13}{16}$, $\frac{7}{8}$, $\frac{29}{32}$, $\frac{13}{16}$, $\frac{31}{32}$, and 1 inch, $1\frac{1}{2}$, $1\frac{1}{16}$, $1\frac{3}{8}$, $1\frac{1}{2}$, $1\frac{1}{16}$, $1\frac{3}{8}$, $1\frac{1}{2}$, $1\frac{1}{16}$, $1\frac{3}{8}$, and $1\frac{1}{2}$ inches; and American-Egyptian cotton of the lengths $1\frac{1}{2}$, $1\frac{1}{16}$, $1\frac{3}{8}$, and $1\frac{1}{2}$ inches. Descriptive staple standards for American upland cotton are in use for the lengths $1\frac{13}{32}$, $1\frac{15}{32}$, $1\frac{17}{32}$, $1\frac{19}{32}$ inches, and upward in gradations of thirty-seconds of an inch. American-Egyptian cotton of the lengths $1\frac{15}{32}$, $1\frac{17}{32}$, $1\frac{19}{32}$, $1\frac{21}{32}$, $1\frac{23}{32}$ inches, and longer than $1\frac{1}{2}$ inches is designated descriptively in gradations of thirty-seconds of an inch.

This bulletin, of the same series as Statistical Bulletins 40, 47, and 52, contains information on the grade, staple length, and tenderabil-

ity of cotton ginned and carried over in the United States. Some of the information is published in more than one of these bulletins in order to provide continuity of the data, thus facilitating comparisons of grade, staple length, and tenderability distributions from year to year.

In this bulletin certain information previously published is omitted. Statistics on the crops of 1928 and 1929 are not included in either the cross-classification figures for American-Egyptian cotton or the staple-length and tenderability figures on ginnings of upland cotton in the individual States. In the table on average staple length of ginnings of upland cotton in States and districts, figures for 1934 only are included, but in another table these figures are supplemented by State averages for 1933 and for the 5-year period 1928-32. In Statistical Bulletins 47 and 52, averages were included for all years for which they were available at the time they were prepared for publication.

Figure 1 (p. 25), constructed to facilitate comparisons of average staple lengths for the different States and changes that have taken place, differs from the corresponding figure in Statistical Bulletins 47 and 52 in that averages for the 5-year period 1928-32 and for the years 1933 and 1934 are shown instead of an average for each individual year for which data were included in those bulletins. Averages were not published in Statistical Bulletin 40.

Figures on the grade and staple of cotton ginned in individual States during specified ginning periods, and figures on the staple length of cotton ginned in districts into which States are divided, are presented for 1934 only. Statistical Bulletins 40 and 47 contain these figures for each individual year. Statistical Bulletin 52 also carries these figures for individual years with the exception of those for ginning periods for 1928. In the case of ginnings of American-Egyptian cotton, figures for grade and for staple by ginning periods are included for 1934 only.

The carry-over statistics for American-Egyptian cotton do not include cross-classifications for 1928, 1929, and 1930, whereas figures for all years for which they were available were published in Statistical Bulletins 40, 47, and 52.

Final figures on the 1934 crop and on the 1935 carry-over are herein published for the first time, although much of the information for the 1934-35 season has been released previously in preliminary form, as was much of that for earlier seasons prior to its publication in final form. This is therefore the first publication issued by the United States Department of Agriculture in which official statistics on the quality of the American cotton crop and carry-over are assembled for 7 consecutive years.

All of the grade, staple-length, and tenderability figures on the crop are based on the classification, according to official standards, of samples of cotton furnished by ginners who cooperated with the Department through its Grade and Staple Statistics Section of the Division of Cotton Marketing. In effecting the cooperative arrangements, ginners agreed to furnish a press-box sample of not less than 4 ounces from each bale ginned at their establishments. The number of samples classed and used as a basis for the grade, staple-length, and tenderability reports was as follows for each of the crops of specified years: 1928, 1,363,226; 1929, 1,012,285; 1930, 1,144,101;

1931, 1,034,860; 1932, 843,473; 1933, 743,317; and 1934, 768,240. The number of gins from which these samples were received in each of the years was as follows: 1928, 1,115; 1929, 784; 1930, 927; 1931, 800; 1932, 772; 1933, 695; and 1934, 899.

The samples drawn by cooperating ginners were forwarded at frequent intervals to classing offices of the Division of Cotton Marketing located at Atlanta, Ga.; Memphis, Tenn.; and Dallas, Austin, and El Paso, Tex. At these offices the samples were classed, according to official standards, and the results of the classification were subsequently assembled for use in preparing the reports on the quality of the crop.²

Figures on the grade, staple length, and tenderability of stocks of cotton in the United States at the beginning of the season on August 1 are based on the classification, according to official standards, of samples representing stocks in public warehouses and compresses, consuming establishments, and other places of storage.

For all years prior to 1934 the same divisions of States were used in the assembling and dissemination of information regarding the quality of the crop. Beginning with that year, however, certain changes were made in the boundaries of some of the districts into which the States of Arkansas, Mississippi, Tennessee, and Texas are divided for purposes of the reports.

In the case of Arkansas, Randolph County was changed from district 1 to district 4; Little River and Miller Counties were changed from district 3 to district 4; and Pike and Hot Spring Counties were changed from district 2 to district 3.

Yazoo and Holmes Counties in Mississippi were changed from district 2 to district 1; Rankin County, from district 2 to district 3; and Amite County, from district 3 to district 2. Clay, Noxubee, and Lowndes Counties, which formerly constituted district 4, were changed to district 3, thus reducing to 3 the number of districts in Mississippi.

In Tennessee, district 1, comprising Obion, Dyer, Lauderdale, Tipton, Shelby, and Lake Counties, was combined with district 2 to form the new district 1, leaving only three districts in the State, the district formerly designated as 3 being changed to 2, and the district formerly designated as 4 being changed to 3.

The greatest number of changes was made in the district boundaries of Texas. In that State, Coleman and Concho Counties were changed from district 4 to district 3; Callahan County, from district 5 to district 3; Hays and Comal Counties from district 4 to district 7; Johnson County, from district 5 to district 7; Atascosa, Duval, LaSalle, and Webb Counties, from district 10 to district 4; and Lavaca and Colorado Counties, from district 9 to district 10.

Statistics presented in this bulletin reflect changes that have taken place in the grade, staple length, and tenderability of cotton in the United States during the period 1928-35. Some of these changes are of special significance.

The production of cotton shorter than $\frac{7}{8}$ inch in staple has definitely decreased, both in number of bales and in the proportion that they constitute of the annual crop. Ginnings of these lengths from the

² Additional information regarding the assembling of basic data on the crop and regarding the preparation of reports is contained in Statistical Bulletin 46, which contains also similar information concerning the carry-over.

crop of 1929 amounted to 2,921,500 bales, or 20.1 percent of the total crop, whereas only 539,100 bales of these lengths, 4.3 percent of the total, were ginned from the crop of 1933, and only 783,000 bales, 8.3 percent of the total, from the crop of 1934. Although the production of cotton shorter than $\frac{1}{8}$ inch in staple was greater in 1934 than in 1933, the number of bales of these lengths ginned from the crop of 1934 was only 26.8 percent as great as the number ginned from the crop of 1929.

The production of cotton ranging from $\frac{1}{8}$ inch to $2\frac{1}{2}$ inch in length of staple has fluctuated from year to year, decreasing on the whole, both in number of bales and in the proportion that they constitute of each annual crop. Ginnings of these lengths from the 1934 crop amounted to 3,490,900 bales, which was but 59 percent as great as the 5,914,800 bales of the same lengths ginned from the 1928 crop and only 63 percent as great as the 5,533,700 bales ginned from the crop of 1929. Except in 1931, the number of bales of cotton ranging from $\frac{1}{8}$ inch to $2\frac{1}{2}$ inch in staple decreased each year from 1928 to 1934.

From 1929 to 1933, the proportion of $1\frac{1}{16}$ -inch and $2\frac{1}{32}$ -inch cotton increased from year to year. Ginnings of these lengths from the 1934 crop were much less than from the crop of any other year during the period 1929-34, and the proportion that these ginnings represented of the total crop of 1934 was less than the corresponding proportion for each of the other years except 1929. This decrease in $1\frac{1}{16}$ -inch and $2\frac{1}{32}$ -inch cotton in 1934, however, was associated with increases in both the number of bales and the proportions of most of the lengths longer than 1 inch, as well as with increases in the number of bales and the proportion of cotton shorter than $\frac{1}{8}$ inch and with a slight increase in the proportion of lengths ranging from $\frac{1}{8}$ inch to $2\frac{1}{32}$ inch.

Production of cotton 1 inch and longer in staple has increased appreciably, on the whole, since the grade and staple reports were inaugurated.

The net effect of changes in staple-length distribution of the crop from one year to another is indicated by the average staple length of cotton ginned. Calculated on the midpoints of staple-length groups, the averages for the crops of specified years, in terms of sixteenths of an inch, are as follows: 1934, 15.58; 1933, 15.55; 1932, 15.45; 1931, 15.44; 1930, 15.22; 1929, 15.11; and 1928, 15.18.³

The proportion of tenderable cotton produced has increased greatly since 1929. Of the upland cotton ginned from the crop of that year, 75.7 percent was of tenderable grades and staples, compared with 84.6 percent of the 1930 crop, 89.3 percent of the 1931 crop, 90.5 percent of the 1932 crop, 93.1 percent of the 1933 crop, and 90.1 percent of the 1934 crop.

The relation of carry-over stocks of American upland cotton to the crops of immediately preceding years is indicated to some extent by differences between average staple lengths. During the period 1929-35 the average staple length of carry-over stocks was greater than the average staple length of the preceding crop in each instance except 1935, when the carry-over of upland cotton averaged slightly shorter in staple than did the crop of 1934. The average staple length of American upland cotton carried over in consuming establishments

³ The averages for 1933 and 1934 are shown in table 6; averages for other years are published in Statistical Bulletin 92 (table 5).

during the period 1928-35 was appreciably greater for each year than the average staple length of upland cotton carried over in other places.

The tenderability of the carry-over of American upland cotton each year during the period 1929-35 differed very little from that of the preceding crop. For 1934 and 1935 the proportion of tenderable cotton in the carry-over was a little less than in the crops of 1933 and 1934, respectively; but during the period 1929-33 there was a greater proportion of tenderable cotton in the carry-over each year than in the preceding crop.

Statistics on American upland cotton and American-Egyptian cotton ginned and carried over are presented separately in this bulletin, and figures on the carry-over of upland cotton are shown separately for public warehouses and compresses and for consuming establishments. Carry-over of foreign cotton imported into this country and remaining on hand on August 1 is also reported separately. Egyptian cotton constituted the greater part of the carry-over of foreign growths each year during the period 1928-35, the remainder being made up chiefly of Peruvian, Chinese, and British Indian growths.

Grades and staples untenderable in settlement of contracts of sale for future delivery made subject to section 5 of the United States Cotton Futures Act and regulations of the Secretary of Agriculture thereunder are marked by footnote references in each table where they are reported.

Throughout the bulletin grades have been abbreviated as follows: 1-M. F., Middling Fair; 2-S. G. M., Strict Good Middling; 3-G. M., Good Middling; 4-S. M., Strict Middling; 5-M., Middling; 6-S. L. M., Strict Low Middling; 7-L. M., Low Middling; 8-S. G. O., Strict Good Ordinary; 9-G. O., Good Ordinary.

TABLE 2.—Grade and staple length of American upland cotton ginned in the United States, by States, crop of 1934.

[Quantities are given in running bales, except that round bales are counted as half bales. Liters are not included.]

¹ Average calculated by multiplying the number of bales in each length group by the midpoint of the group expressed in sixteenths of an inch (that is, $1\frac{1}{16}$ and $3\frac{1}{16} = 15.5$, etc.), summing, and dividing by the total number of bales. The midpoint of the $1\frac{1}{16}$ - and $1\frac{1}{16}$ -inch group, for example, was taken as 15.5 sixteenths ($3\frac{1}{16}$) inch because according to regulations $1\frac{1}{16}$ is the lower limit of the group which includes all cotton classed as being as long as $1\frac{1}{16}$ and shorter than 1 inch. In making calculations, the midpoints of the groups "shorter than $1\frac{1}{16}$ " and " $1\frac{1}{16}$ inches and longer" were considered to be 13.5 and 20.5, respectively. Averages can be converted to inches by dividing by 16.

* For location of districts into which States are divided, see maps accompanying tables for individual States, by districts, pp. 42-61.

² Includes Illinois, Kansas, and Kentucky.

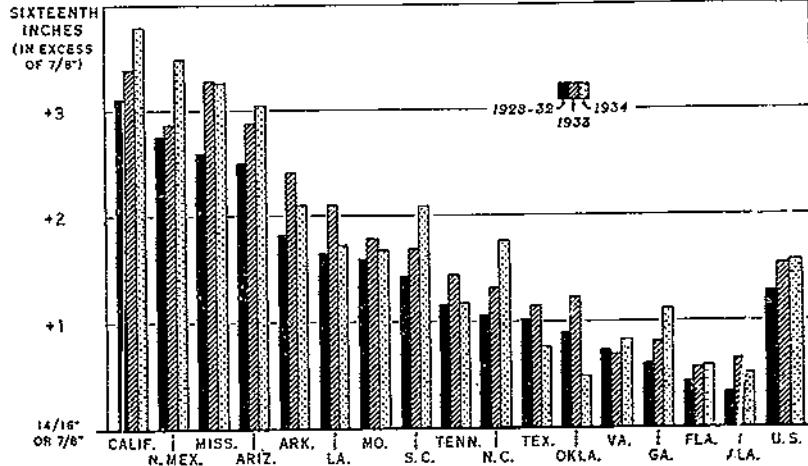

GRADE, STAPLE LENGTH, AND TENDERABILITY OF COTTON 25

TABLE 6.—*Average staple length¹ of American upland cotton ginned in the United States, by States, crops of 1934, 1933, and 1928-32*

State	1934	1933	5-year period 1928-32	State	1934	1933	5-year period 1928-32

Mississippi	17.28	17.20	16.61	All other ²	16.16	16.02	16.45

¹ Average calculated by multiplying the number of bales in each length group by the midpoint of the group expressed in sixteenths of an inch (that is, $\frac{1}{16}$ and $\frac{3}{16}$ —=15.5, etc.), summing, and dividing by the total number of bales. The midpoint of the $\frac{1}{16}$ - and $\frac{3}{16}$ -inch group, for example, was taken as 15.5 sixteenths ($\frac{2}{16}$) inch because according to regulations $\frac{1}{16}$ is the lower limit of the group which includes all cotton classed as being as long as $\frac{1}{16}$ and shorter than 1 inch. In making the calculations, the midpoints of the groups "shorter than $\frac{1}{16}$ " and " $\frac{1}{16}$ and longer" were considered to be $\frac{1}{16}$ and 20.5, respectively. Averages can be converted to inches by dividing by 16. Averages for each individual year of the period 1928-32 are published in table 5 of Statistical Bulletin 52.

² Includes Illinois, Kansas, and Kentucky.

FIGURE 1.—Average staple length of American upland cotton in excess of $\frac{7}{16}$ inch.

The cotton-growing States are here arranged according to the 5-year average staple length of cotton ginned from the crops of 1928-32. The average staple length of cotton ginned in the United States has increased from year to year since 1929.

TABLE 7.—*Grade of American upland cotton ginned in the United States during specified periods,¹ by States, crop of 1934*

[Quantities are given in running bales, except that round bales are counted as half bales. Linters are not included]

¹ Average calculated by multiplying the number of bales in each length group by the midpoint of the group expressed in sixteenths of an inch (that is, $1\frac{1}{16}$ and $2\frac{1}{16}=15.5$, etc.), suminating, and dividing by the total number of bales. The midpoint of the $1\frac{1}{16}$ - and $2\frac{1}{16}$ -inch group, for example, was taken as 15.5 sixteenths ($2\frac{1}{16}$) inch because according to regulations $1\frac{1}{16}$ is the lower limit of the group which includes all cotton classed as being as long as $1\frac{1}{16}$ and shorter than 1 inch. In making the calculations, the midpoints of the groups "shorter than $7\frac{1}{8}$ inch" and " $1\frac{1}{4}$ inches and longer" were considered to be 13.5 and 20.5, respectively. Averages can be converted to inches by dividing by 16.

² Figures include cotton reported by the Bureau of the Census as "elsewhere."

¹ Foreign cottons are not deliverable in settlement of futures contracts made subject to the United States Cotton Futures Act.² As reported by the Bureau of the Census.

[PUBLIC NO. 740 - 89TH CONGRESS]

[S. 4716]

An Act Authorizing the Secretary of Agriculture to collect and publish statistics of the grade and staple length of cotton.

Be it enacted by the Senate and House of Representatives of the United States of America in Congress assembled, That the Secretary of Agriculture be, and he is hereby, authorized and directed to collect and publish annually, on dates to be announced by him, statistics or estimates concerning the grades and staple length of stocks of cotton, known as the carry-over, on hand on the 1st of August of each year in warehouses and other establishments of every character in the continental United States, and following such publication each year, to publish, at intervals in his discretion, his estimate of the grades and staple length of cotton of the then current crop: *Provided*, That not less than three such estimates shall be published with respect to each crop. In any such statistics or estimates published, the cotton which on the date for which such statistics are published may be recognized as tenderable on contracts of sale of cotton for future delivery under the United States Cotton Futures Act of August 11, 1910, as amended, shall be stated separately from that which may be untenderable under said Act as amended.

Sec. 2. That the information furnished by any individual establishment under the provisions of this Act shall be considered as strictly confidential and shall be used only for the statistical purpose for which it is supplied. Any employee of the Department of Agriculture who, without the written authority of the Secretary of Agriculture, shall publish or communicate any information given into his possession by reason of his employment under the provisions of this Act shall be guilty of a misdemeanor and shall, upon conviction thereof, be fined not less than \$300 or more than \$1,000, or imprisoned for a period of not exceeding one year, or both so fined and imprisoned, at the discretion of the court.

Sec. 3. That it shall be the duty of every owner, president, treasurer, secretary, director, or other officer or agent of any cotton warehouse, cotton ginnery, cotton mill, or other place or establishment where cotton is stored, whether conducted as a corporation, firm, limited partnership, or individual, and of any owner or holder of any cotton and of the agents and representatives of any such owner or holder, when requested by the Secretary of Agriculture or by any special agent or other employee of the Department of Agriculture acting under the instructions of said Secretary to furnish completely and correctly, to the best of his knowledge, all of the information concerning the grades and staple length of cotton on hand, and when requested to permit such agent or employee of the Department of Agriculture to examine and classify samples of all such cotton on hand. The request of the Secretary of Agriculture for such information may be made in writing or by a visiting representative, and if made in writing shall be forwarded by registered mail, and the registry receipt of the Post Office Department shall be accepted as evidence of such demand. Any owner, president, treasurer, secretary, director, or other officer or agent of any cotton warehouse, cotton ginnery, cotton mill, or other place or establishment where cotton is stored, or any owner or holder of any cotton or the agent or representative of any such owner or holder, who, under the conditions hereinbefore stated, shall refuse or willfully neglect to furnish any information herein provided for or shall willfully give answers that are false or shall refuse to allow agents or employees of the Department of Agriculture to examine or classify any cotton in store in any such establishment, or in the hands of any owner or holder or of the agent or representative of any such owner or holder, shall be guilty of a misdemeanor and, upon conviction thereof, shall be fined not less than \$300 or more than \$1,000.

Sec. 4. The Secretary of Agriculture may cooperate with any department or agency of the Government, any State, Territory, District, or possession, or department, agency, or political subdivision thereof, or any person; and shall have the power to appoint, remove, and fix the compensation of such officers and employees, not in conflict with existing law, and make such expenditures for the

purchase of samples of cotton, for rent outside the District of Columbia, printing, telegrams, telephones, books of reference, periodicals, furniture, stationery, office equipment, travel, and other supplies and expenses as shall be necessary to the administration of this Act in the District of Columbia and elsewhere, and there are hereby authorized to be appropriated, out of any moneys in the Treasury not otherwise appropriated, such sums as may be necessary for such purposes.

Sec. 5. That, of the reports issued by the Secretary of Agriculture, pursuant to the Act entitled "An Act authorizing the Department of Agriculture to issue semi-monthly cotton crop reports and providing for their publication simultaneously with the ginning reports of the Department of Commerce," approved May 3, 1924, only five shall be issued hereafter, one as of August 1, one as of September 1, one as of October 1, one as of November 1, and one as of December 1, each of which shall state the condition and progress of the crop and the probable number of bales which will be ginned, these reports to be issued simultaneously with the cotton ginning reports of the Bureau of the Census relating to the same dates, the two reports to be issued from the same place at eleven antemeridian of the eighth day following that to which the respective reports relate. When such date of release falls on Sunday or a legal holiday the report shall be issued at eleven o'clock antemeridian of the next succeeding workday.

Sec. 6. The Secretary of Agriculture shall cause to be issued a report on or before the 10th day of July of each year showing by States and in toto the number of acres of cotton in cultivation on July 1, to be followed on September 1 and December 1 with an estimate of the acreage of cotton abandoned since July 1.

Approved, March 3, 1927.
