EXPLANATION

Estimates of chicks produced by commercial hatcheries are made, monthly and annually, by the United States Department of Agriculture. Basic data for these estimates are obtained from comprehensive surveys of the industry made at intervals of about 5 years, under sponsorship of the Department of Agriculture, as these items are not obtained by the United States Agricultural Census. The most recent of these was an extensive survey of hatchery operations made in 1943, and previous to that, in 1938. For periods between these bench-mark surveys, estimates are based upon sample data from a large segment of the industry. The estimates published in this report reveal the changes that have occurred in the hatchery industry from 1938 through 1943.

The 1943 hatchery survey was conducted by the State Agricultural Statisticians of the Bureau of Agricultural Economics in cooperation with State Departments of Agriculture, State Agricultural Colleges, the National Poultry Improvement Plan, members of the International Baby Chick Association, and other interested organizations. An effort was made in this survey to obtain at least the capacity of every commercially operated hatchery in the United States.

INTRODUCTION

The commercial hatchery industry is a vital part of the poultry industry in the United States. Commercial hatcheries operate in every State. In 1943, about 84 percent of the chickens raised on farms were purchased as baby chicks from commercial hatcheries.

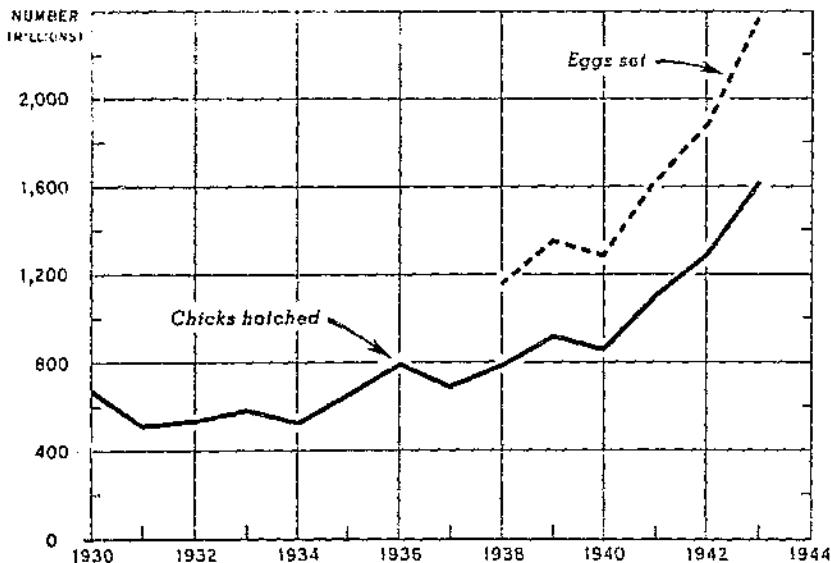

FIGURE 1.—Number of chicks hatched annually by commercial hatcheries in the United States, 1930-43. The annual output of chicks by commercial hatcheries more than doubled from 1930 to 1943.

In addition, commercial hatcheries produced 286 million commercial broiler chicks in 1943. The industry, in supplying the chicks necessary to meet the greatly expanded need for poultry products for war purposes, has made marked changes in capacity and chick production since 1938 (fig. 1). The record output of chicks in 1943 may not again be reached by the hatchery industry for some time to come.

NUMBER OF HATCHERIES

The number of hatcheries has decreased 4 percent since 1938 (table 1). The 1943 survey figures show that 10,112 hatcheries were in operation in the United States at the close of 1943, as compared with 10,531 in 1938. Pennsylvania, with 636 hatcheries, had the highest number of hatcheries in any State; Iowa was second with 624; and Texas was third with 615.

In 20 States, between 1938 and 1943, numbers of hatcheries increased. In 25 States, numbers decreased. In 3 States, no change was shown. Most of the increases occurred in the South Atlantic and South Central regions. Numbers declined principally in the East North Central, New England, and Pacific Coast States. A decline of 109 hatcheries in California was the largest shown for any State; Illinois was next with a decrease of 96 hatcheries.

UNITED STATES, 1938 AND 1943

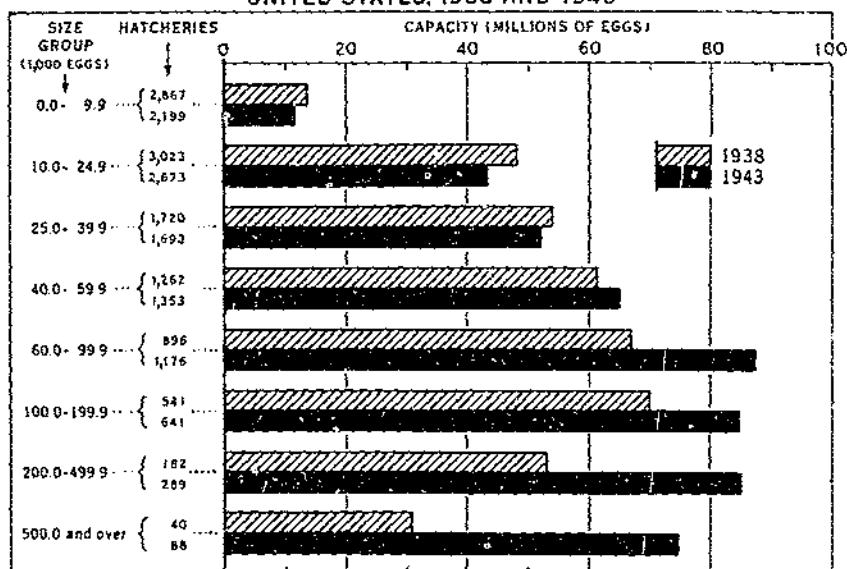

FIGURE 2.—Capacity of commercial hatcheries by size groups in the United States in 1938 and 1943. The number and capacity of hatcheries have decreased in the size groups having egg capacities of less than 40,000 eggs. All other size groups have shown increases in number and capacity.

HATCHERY CAPACITY

Hatcheries that were operating in 1943 had a total incubator capacity of 504,640,000 eggs, compared with a total capacity of 397,376,000 in 1938—an increase of 27 percent. In all regions except the Pacific coast,

COMMERCIAL HATCHERY CHICK PRODUCTION

3

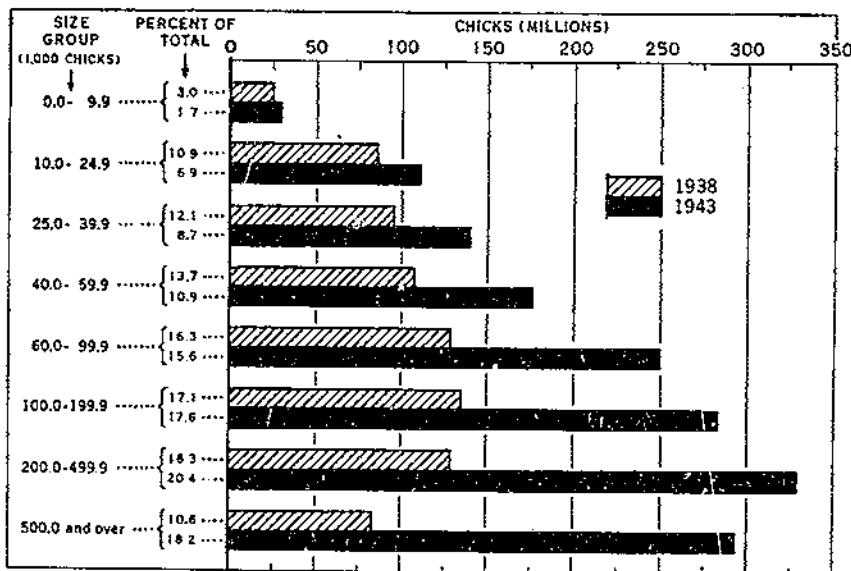

FIGURE 3.—Number of chicks hatched by commercial hatcheries, by size groups, in the United States, 1938 and 1943. Hatcheries with capacities of 60,000 eggs and over, which comprise about 22 percent of the total number, produced about 72 percent of all hatchery chicks in 1943.

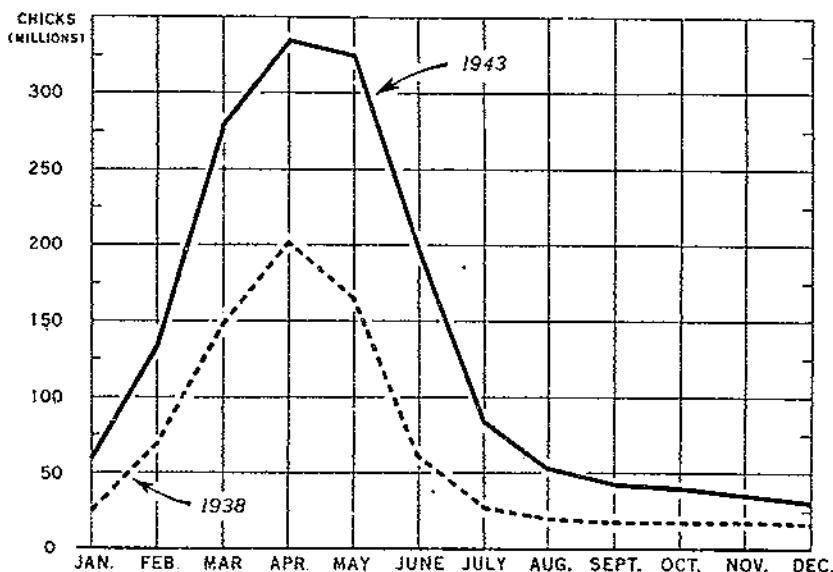

FIGURE 4.—Number of chicks hatched monthly by commercial hatcheries in the United States, 1938 and 1943. Approximately 60 percent of the annual output of chicks is usually produced during March, April, and May.

incubator capacity increased during the 5-year period (table 1). The smallest increase was 11 percent in the East North Central States. The South Atlantic and South Central States showed the greatest increases—97 and 48 percent, respectively. The largest percentage changes in capacity in individual States occurred in these two regions. Delaware led with an increase of 202 percent, North Carolina was second with an increase of 161 percent, and Georgia third with an increase of 159 percent. The largest quantity increases in egg capacity were in Missouri (14,829,000 eggs), Minnesota (11,154,000 eggs), and Iowa (7,962,000 eggs).

In 1943 the average capacity per hatchery was 49,900 eggs, compared with 37,700 in 1938. Table 2 shows the changes within the 8 size groupings of hatcheries between 1938 and 1943. The number and capacity of hatcheries have decreased in the size groups that have egg capacities of less than 40,000. In all other size groups, the number of hatcheries and their egg capacities have increased. The capacity of hatcheries in the 500,000-eggs-and-over group increased by 43,995,000 eggs from 1938 to 1943—41 percent of all the expansion in the industry between 1938 and 1943 (fig. 2).

RATE OF HATCH

The average percentage of eggs hatched changed very little in this period. In 1938 the average-percentage hatch for the United States was 68.2 and in 1943 it was 68.3. The New England States had the highest percentage hatch in 1943 with 69.8, followed by the West North Central States with 69.3 percent (table 3). The Mountain States, with 65.0 percent, had the lowest. Vermont led all States, with 72.7 percent hatch. Utah and Wyoming were lowest among the States, with 60.9 and 63.8 percent, respectively.

RATE OF CAPACITY UTILIZATION

Eggs set per unit of capacity of the hatchery is a significant item. The average number of eggs set per unit of capacity for the United States in 1943 was 4.67 eggs, as compared with 2.90 eggs in 1938. An average of 3.19 chicks were hatched per unit of capacity in 1943 as compared with 1.98 chicks in 1938. The New England States set an average of 7.10 eggs per unit of capacity and led all other regions. Delaware led all States, with an average of 8.66 eggs per unit of capacity. Other States with a high utilization of existing capacity were Connecticut, Rhode Island, Maryland, New Hampshire, and Florida. A considerable number of individual hatcheries reported as high as 10 eggs set per unit of capacity in 1943. A definite relationship apparently exists between size of hatchery and rate of capacity utilization, with the rate of capacity utilization increasing as the size of hatchery increases. Many of the larger hatcheries operate on a year-round basis, supplying chicks for the rapidly expanding commercial broiler production (tables 4 and 5).

CHICK PRODUCTION

From 1938 to 1943, the annual output of chicks by commercial hatcheries more than doubled. About 1,609,121,000 chicks were

produced in 1943, as compared with 785,687,000 in 1938. The output increased decidedly in all sections and in all States (tables 1 and 7). The South Atlantic and South Central States showed the largest percentage increases. The output of chicks in the South Atlantic States during 1943 totaled 222,483,000, compared with 67,733,000 in 1938—an increase of 228 percent. The output during 1943 in the South Central States totaled 185,427,000, compared with 80,075,000 in 1938—an increase of 132 percent. Other increases were 99 percent in the Middle Atlantic States, 95 percent in the West North Central States, 93 percent in the New England States, 83 percent in the Pacific Coast States, 80 percent in the Mountain States, and 79 percent in the East North Central States.

The 3 States that showed the largest percentage gain were Delaware, with a gain of 622 percent, Georgia, 354 percent, and Louisiana, 262 percent. The 3 States making the largest actual gain in output were Missouri, with an increase of 74,284,000 chicks, Illinois, with an increase of 61,347,000, and Iowa, with an increase of 52,776,000.

Hatcheries with capacities of 60,000 eggs and over, comprising about 22 percent of the total number, produced 72 percent of the hatchery chicks in 1943 (fig. 3). Almost one-fifth (18.2 percent) of the chicks hatched in 1943 were produced by the 88 largest hatcheries that have egg capacities of 500,000 eggs and over.

ESTIMATING TOTAL HATCH

The method used in estimating the 1943 production can be called the ratio-to-capacity method. As the number of eggs set and, therefore, the number of chicks hatched per unit capacity vary with the size of hatchery, the total operating capacity was established for each of eight size groups within each State. To establish the ratio of production to capacity the hatcheries replying to the questionnaires were segregated into these eight size groups.

Taking each size group as a unit, the ratios of chicks hatched and eggs set to total egg capacity were calculated for those replying. These ratios were applied to the total estimated capacity of all hatcheries in the size group in order to compute the totals of eggs set and chicks hatched.

The assumption on which this procedure is based is that the operations of the hatcheries that did not reply to the questionnaire would be on approximately the same scale as those of the hatcheries within the same capacity size group in the same State that did reply. The sum of the totals of the eight size groups is the estimated total production for the State.

After annual estimates of production for each size group had been established, estimates of monthly operations were made by distributing the annual production by size groups according to the monthly percentage distribution shown by hatcheries that reported monthly operations. Returns that reported production were received from hatcheries having 72 percent of the total estimated egg capacity of all hatcheries in the United States. The estimates of total hatchings based upon these returns indicate that they produced 72.7 percent of all chicks:

CHICKS HATCHED ON YEAR-ROUND BASIS

The main hatching season runs from January through July. More than 80 percent of the annual output of chicks is produced during these months. Approximately 60 percent of the annual production is usually produced during the 3 months of March, April, and May. The volume of hatchings apparently remains fairly constant from August to December. During each of the months, August, September, October, November, and December production is approximately 2 to 3 percent of the annual production. The production of hatchery chicks during the period August through December, is small when compared with production during the other months of the year. But its importance to the hatchery industry becomes apparent when it is pointed out that the greater part of this seasonal hatch is for commercial broilers, which were not prominent in the markets 10 years ago. It represents the sale of millions of chicks during a period in which, a few years ago, very few were hatched (fig. 4).

In all but a few States, some chicks are hatched by commercial hatcheries during every month of the year. The output ranges by States from a few thousand to millions of chicks. When the demand for commercial broilers is good, as in 1943, many hatcheries in the New England, South Atlantic, and South Central States operate during every month of the year, with very little variation in monthly output (tables 8 to 14).

Principal States in which hatchery chicks are produced in volume during every month, are Connecticut, Massachusetts, and New Hampshire in the New England States; Pennsylvania and New Jersey in the Middle Atlantic States; Delaware, Maryland, Virginia, North Carolina, Georgia, and Florida in the South Atlantic States; Indiana, Ohio, and Illinois in the East North Central States; Missouri in the West North Central States; Texas, Oklahoma, and Arkansas in the South Central States; Arizona in the Mountain States; and California in the Pacific Coast States. The rapid growth of the commercial broiler industry in the South Atlantic and South Central States is mainly responsible for the large increase shown by the hatchery industry.

VALUE OF CHICKS PRODUCED

The estimated value of chicks produced by commercial hatcheries in 1943 was \$223,076,000, the highest in the history of the industry. Prices for chicks averaged the highest in the Pacific Coast and New England States (table 14). The average price was lowest in the South Central States. Iowa led all States in the total value of chicks produced in 1943, with Missouri, Illinois, and Indiana ranking next in importance in the order named.

NUMBER OF CHICKS SEXED 1943

The segregation of pullets from cockerel chicks is one of the latest developments in the poultry industry. The commercial development of sexing chicks began during the 1934 chick season and was chiefly confined to the Pacific Coast States. Since 1934, a large number of

schools have been established to train chick sexers and the practice of sexing chicks has spread among the hatcheries throughout the country. The sexing of baby chicks has filled a distinct need in the poultry industry by enabling commercial egg producers to buy pullet chicks only, thus eliminating the expense and work of brooding and feeding unwanted male chicks. More Leghorn chicks are sexed than any other breed, because the Leghorn is the dominant breed in commercial egg-laying flocks. Many unwanted Leghorn male chicks are usually destroyed each year. Very few cockerels of the heavy breeds are destroyed because they find a ready market with commercial broiler producers.

The practice of sexing varies widely among hatcheries. For the country as a whole about 1 out of every 6 chicks hatched in 1943 was sexed. The percentage of sexed chicks to total chicks hatched in the various States ranged from less than 1 percent in Nevada, Wyoming, and Alabama to 34 percent in Michigan and Wisconsin. Every chick hatched was in demand in 1943, regardless of sex, so the proportion of chicks sexed in some of the States may have been somewhat lower than usual. More chicks are sexed in proportion to total chicks hatched in the Pacific Coast States than in any other geographic division of the country (table 15).

10 STATISTICAL BULLETIN NO. 81, U. S. DEPT. OF AGRICULTURE

TABLE 3.—*Eggs set and chicks hatched per unit of capacity and percentage hatched by States, 1938 and 1943—Continued*

State and division	Eggs set		Chicks hatched		Percentage hatch	
	1938	1943	1938	1943	1938	1943
Arkansas.....	Number 3.00	Number 6.10	Number 2.13	Number 4.05	Percent 70.8	Percent 66.4
Louisiana.....	3.70	5.80	2.93	3.81	63.3	65.7
Oklahoma.....	2.62	4.63	1.83	3.13	69.9	69.2
Texas.....	2.70	4.44	1.95	3.05	70.0	68.7
South Central.....	2.80	4.63	2.02	3.16	69.9	68.2
Montana.....	2.56	3.82	1.71	2.62	66.8	65.8
Idaho.....	2.43	3.65	1.63	2.65	67.2	67.0
Wyoming.....	2.32	3.31	1.46	2.11	62.0	61.8
Colorado.....	2.72	3.78	1.55	2.42	68.2	64.1
New Mexico.....	2.01	4.10	1.80	2.87	63.8	68.6
Arizona.....	2.70	5.15	1.84	3.44	63.2	66.8
Utah.....	1.65	2.70	1.03	1.70	62.3	60.0
Nevada.....	2.04	2.64	1.46	1.85	71.8	70.3
Mountain.....	2.42	3.79	1.62	2.46	67.1	65.0
Washington.....	2.18	4.01	1.47	2.82	67.7	70.2
Oregon.....	1.70	3.51	1.17	2.40	69.0	70.3
California.....	2.54	5.42	1.63	3.55	64.4	65.5
Pacific.....	2.31	4.81	1.53	3.22	65.5	66.8
United States.....	2.90	4.67	1.98	3.19	68.2	69.3

TABLE 4.—*Eggs Set: Number per unit of capacity and percentage hatched, by size groups, United States, 1938 and 1943*

Size groups (number of eggs)	Total		Per unit of capacity		Percentage hatched	
	1938	1943	1938	1943	1938	1943
			Thousands	Thousands	Number	Number
Under 10,000.....	34,623	40,752	2.54	3.57	68.9	68.3
10,000 to 24,999.....	124,302	161,234	2.58	3.73	68.8	68.9
25,000 to 39,999.....	139,738	201,936	2.58	3.92	63.1	68.2
40,000 to 59,999.....	158,350	235,783	2.50	3.07	67.8	66.0
60,000 to 99,999.....	158,901	367,806	2.53	4.20	67.0	68.0
100,000 to 199,999.....	195,333	412,746	2.81	4.86	67.6	68.6
200,000 to 499,999.....	157,561	482,093	3.55	5.66	68.3	68.1
500,000 and over.....	120,058	428,932	3.90	5.74	69.1	68.2
All sizes.....	1,152,436	2,357,322	2.90	4.67	68.2	68.3

TABLE 5.—*Salable chicks hatched: Number and per unit of capacity, by size groups, United States, 1938 and 1943*

Size groups (number of eggs)	Total		Percentage of total		Per unit of capacity	
	1938	1943	1938	1943	1938	1943
			Thousands	Thousands	Percent	Percent
Under 10,000.....	23,835	27,851	3.0	1.7	1.73	2.44
10,000 to 24,999.....	85,220	111,153	10.9	6.5	1.78	2.57
25,000 to 39,999.....	65,170	139,846	12.1	8.7	1.76	2.67
40,000 to 59,999.....	107,358	176,057	13.7	10.9	1.76	2.70
60,000 to 99,999.....	128,264	259,146	16.3	15.6	1.56	2.56
100,000 to 199,999.....	174,208	281,029	17.1	17.6	1.92	3.33
200,000 to 499,999.....	125,311	325,475	16.3	20.4	2.42	3.85
500,000 and over.....	82,981	292,561	10.6	18.2	2.60	3.91
All sizes.....	785,067	1,609,121	100.0	100.0	1.93	3.10

COMMERCIAL HATCHERY CHICK PRODUCTION
