CROP REPORTING BOARD

FARM PRODUCTION, FARM DISPOSITION, AND VALUE OF FIELD SEED CROPS
REVISED ESTIMATES, 1939-50 1/

This publication presents statistics on farm production, farm disposition, and value of six important field seed crops--alfalfa, red clover, alsike clover, sweetclover, timothy, and lespedeza--for the period 1939-50. Also contained herein are statistics on farm production and farm value of all other field seed crops for the same period or parts of that period for which the Crop Reporting Board of the Bureau of Agricultural Economics has prepared estimates. Farm disposition estimates are not available for any of the field seed crops except the six specifically mentioned above. This publication brings together, and revises where necessary, estimates previously published in various reports. It supplements the publication "Revised Estimates, 1939-51, Acreage, Yield, and Production of Field Seed Crops," issued in June 1952, with farm disposition, when available, and farm-value estimates. Revisions of these items from previously published estimates are primarily a result of revised production estimates. In a few cases, however, season average prices have also been revised.

Disposition estimates are based on returns from special disposition inquiries, in which farmers report on the quantities of the seed crops produced that are sold and held for use on their own farms. Wherever possible, sales are checked with such independent data as reports of dealers, records of shipments, and verification of origin data (alfalfa seed only).

Season average prices for the six important seed crops are averages in which the mid-month prices published currently in "Agricultural Prices," are weighted for each State by the estimated quantities sold in that State in each month of the crop-marketing season. In some States, in addition to reported mid-month prices, season average price data are obtained through a crop check of dealers' purchases. For all other field seed crops special surveys as well as dealer crop-check data are the primary basis for determining season average prices.

Both value of sales, and value of production are computed by applying the season average price to the estimated quantity sold, or to production. These value estimates are for the marketing season or crop year; they should not be confused with cash income, which is calculated on a calendar-year basis.

1/Prepared by G. C. Edler, T. J. Kuzelka, and R. E. Sutherland, with the assistance of State Agricultural Statisticians and under the general direction of C. E. Burkhead, Head, Division of Field Crop Statistics.
