CHICKENS AND EGGS, 1925-44 1/

This bulletin presents a record of the official estimates of the United States Department of Agriculture relating to monthly egg production for the years 1925-44. The statistical series in this bulletin supersede all series published prior to this date. They are comparable to the 1945-49 series published in April 1952. In addition to egg production these estimates relate to young chickens and layers on farms and rate of lay on the first day of the month.

Current estimates have been released in mimeographed reports and other publications. Estimates have also been published every 5 years following revisions based on the United States census of chickens on farms. However, supplies of previous publications relating to years in the 1925-44 series have become exhausted. In general, estimates in this publication relating to monthly egg production are the same as previously published, except the rate of lay and total egg production in 1940-44 in Oregon and the United States, where they are revised. Numbers of layers on farms and rate of lay on the first day of the month for the years 1925-44 are published for the first time in this bulletin.

The estimates shown in this publication are believed to indicate, within reasonable limits of accuracy, the actual number of layers and young chickens on farms, rates of lay, and total egg production; and with greater accuracy, the direction and extent of the changes from year to year.

The explanations that follow are intended to cover only the source and extent of the data used in making these estimates. For detailed explanations of the methods used in making these estimates, refer to Miscellaneous Publication No. 703, The Agricultural Estimating and Reporting Services of the United States Department of Agriculture.

MONTHLY EGG PRODUCTION, 1925-44

The monthly estimates of total numbers of layers, eggs per layer on hand, and total eggs produced are based on returns from about 25,000 crop respondents who report for the first day of each month the number of layers on hand and the number of eggs produced "yesterday," that is, current daily egg production.

Terms and Methods Used

Number of Layers: The average number of layers on hand during the month is the mean of the estimated number on the first of that month and the first day of the succeeding month. Estimates of the total number of layers on the first of each month are made on the basis of the monthly reports on the number of layers on crop reporters' farms. The number of layers on farms January 1, as estimated annually, serves as the starting point for these monthly estimates. Benchmark data on chickens over 4 months old are available from the census every 5 years.

1/Prepared by E. Smith Kimball, Paul W. Smith, and Robert F. Moore, Agricultural Statisticians, with the assistance of the State Agricultural Statisticians and under the general direction of A. V. Nordquist, Head, Division of Livestock and Poultry Statistics.

Rate of Lay: The number of eggs laid during the month per layer on hand is the mean of the estimated rate on the first of that month and the rate on the first of the succeeding month. These estimates also are based upon the monthly returns. The estimated rate of lay makes allowance for the variation of the sample flocks from the average of all flocks. The reported rate of lay is affected by such factors as size of flock and degree of commercialization. By multiplying the estimated daily average by the number of days in the month, the number of eggs produced per layer during the month is obtained.

Total Egg Production: After the average number of layers and the number of eggs produced per layer have been estimated for each month, total monthly egg production is obtained by multiplying the number of layers by the number of eggs produced per layer. An estimate of total egg production, for any period of months, is obtained by adding the production of the months involved.

Adjustments at End of Year: The annual estimates of layers on January 1 of each year are based on an annual survey of about 150,000 flocks made in cooperation with the Post Office Department through the rural mail carriers, in addition to the returns from the regular monthly crop respondents. At the end of the year, it is necessary in some States to make some revisions in the number of layers on the first of the month so that these will be in agreement with the January 1 estimates. The monthly rates of lay are then applied to the revised number of layers on hand during the month to secure the total egg production for each month.

YOUNG CHICKENS ON FARMS, 1931-44

These estimates give the number of young chickens on farms from April 1 to July 1, inclusive, the number of pullets not yet of laying age August 1 to February 1, inclusive; the composition of the farm flock on January 1 and October 1, and the number of chicks under 3 months old on September 1. They are based on information from about 25,000 crop respondents who report for the first day of the month the number of layers on hand and the number of young chickens by classes as indicated above. Current estimates appear in the monthly Crop Production Reports.

The number of young chickens on hand (April 1 to July 1) is derived by applying to the estimated number of layers as published each month the estimated percentage that the number of young chickens is of the number of layers.

The number of pullets not yet of laying age and other classes of young chickens and of hens are estimated in a similar manner, using the relationship of the various classes to layers and applying the percentage for each class to the number of layers on the first of the month.

The various classes of young chickens and hens that make up the farm flock are estimated on October 1 and January 1. Potential layers (hens and pullets of laying age plus pullets not of laying age) are estimated monthly on August 1 to February 1, inclusive.

As estimates of young chickens are based on the relationship between numbers of young chickens and numbers of layers in sample flocks, these estimates of young chickens are revised at the end of the year whenever estimates of layers are revised. Although the basic data are available for all States, the estimates were prepared only by regions and for the United States. Estimates by States, therefore, are not available.
