Index of tables	9

Since the publication by the Bureau of Agricultural Economics in December 1943 of a statistical summary for American-Egyptian cotton 2/ certain new developments have affected this crop. New and improved varieties have been developed; a law was passed by the 82d Congress which spells out price-support procedures for the crop; standards for grades of this cotton have been revised; and production, consumption, and prices have shown wide variations. This report brings the statistics contained in the earlier publication to date, adds some additional statistical series to those previously published, and analyzes the situation and outlook for American-Egyptian cotton.

NEW VARIETIES OF AMERICAN-EGYPTIAN COTTON

Porter's report 2/ explains the development of the various varieties of American-Egyptian cotton from 1911 to 1943.

Porter says, 3/ "The first American strain of Egyptian cotton to be grown commercially in this country was a variety known as 'Yuma'. It was first produced commercially in the Salt River Valley in Arizona and in the Imperial Valley in California about 1911. By 1919 'Yuma' cotton had been almost entirely displaced by 'Pima' cotton, an American-Egyptian variety which monopolized the

1/ Data for this report were compiled by Susie J. Frazier.

2/ Porter, Horace G. Some Phases of the American-Egyptian Cotton Situation and Outlook with Statistical Supplement. Bur. Agr. Econ., Washington, D. C. December 1943. (Processed.)

3/ See footnote 2 above.

field up to the time a new variety, "S x P", was introduced about 1934. "S x P", which is a cross between Egyptian Sakellaridis and American-Egyptian Pima, gradually displaced Pima and has since become the only variety of American-Egyptian cotton in commercial production in this country."

Since 1943, two new varieties have replaced "S x P", "Amsak" and "Pima 32." Amsak was developed by crossing "S x P" with "Sakel" and was first produced commercially in 1943. Pima 32 is the result of crossing "S x P", "Pima", and "Giza 7", an Egyptian variety. It was first grown commercially in 1948. "Pima 32" has almost completely replaced "S x P." ^{4/} Currently, only a small quantity of Amsak is produced. ^{5/}

A new variety of American-Egyptian Cotton, called Pima S-1, is being put into commercial production for the first time. About 3,000 acres of this variety are to be planted in 1953. Preliminary spinning tests indicate that the quality characteristics of Pima S-1 are equal to those of Karnak, Amsak, and Pima 32.

REVISION OF GRADE STANDARDS

Effective August 1, 1952, the "Official Cotton Standards of the United States for the Grade of American-Egyptian Cotton" were revised. In general, the standards were changed to coincide with the kind of cotton now produced.

The grade designations were revised so that grades are no longer designated as "half" grades. The equivalent old and new designations are shown below:

Grade Designations

<u>Old</u>	<u>New</u>
1	1
1-1/2	2
2	3
2-1/2	4
3	5
3-1/2	6
4	7
4-1/2	8
5	9

^{4/} For a detailed description of the development of the various American-Egyptian varieties, see Hathorn, Scott, Jr. American Egyptian Cotton; Ariz. Agr. Expt. Sta. Bul. 238, November 1951, pp. 7 to 10.

^{5/} United States Department of Agriculture, Production and Marketing Administration, Cotton Branch. Cotton Varieties Planted 1950-52. Memphis, Tenn., July 1952, table 25, p. 27.

As the statistics in this report are for years prior to August 1, 1952, all grades mentioned in this report refer to the old designations.

PRODUCTION

Prior to the 1920's, relatively large quantities of Sea Island cotton were produced. From 1910 to 1915 the yearly average was 88,500 bales. However, after 1919, production stayed below 5,100 bales a year and since 1945 less than 100 bales a year have been produced (table 4).

Production of American-Egyptian cotton increased at the same time that production of Sea Island cotton declined. American-Egyptian cotton partially replaced Sea Island, whose production declined because of damage by boll weevils. However, boll weevils are not a production hazard in the Arizona-California area where American-Egyptian cotton is grown.

The crop of 1914 was the first American-Egyptian crop to exceed 5,000 bales (see table 4). During the 1920's production of this variety averaged 30,700 bales a year. During the 1930's average yearly production declined to 16,300 bales.

During World War II, the Commodity Credit Corporation operated purchase programs for American-Egyptian cotton. These programs were designed to promote increases in production which were needed for national security purposes. (See table 6). Production reached a peak of 73,800 bales in 1942. Purchase programs were not in operation and price-support operations at lower levels in relation to prices of upland cotton were maintained by CCC loans from 1944 to 1949. During this period production dropped to a yearly average of 3,900 bales. In 1950 production increased sharply. Purchase prices of more than a dollar a pound were maintained in 1951 and 1952 to stimulate production for stockpiling purposes. Production increased to 93,500 bales in 1952.

Hathorn 6/ estimates that from 1930 to 1950 the price of American-Egyptian cotton had to be 1.7 to 2.5 times that of American upland to give Arizona growers the same return from both types of cotton. The break-even ratio in this period averaged 2.1. A comparison of actual and break-even prices is shown in table 1.

If production of American-Egyptian cotton were dependent upon the difference between its break-even and actual prices, the acreage planted to American-Egyptian would have varied as this difference between the two prices varied in the preceding crop-year. But such a variation in acreage did not occur. Other factors influenced the planting of American-Egyptian cotton. Among them was the influence of acreage allotments for upland cotton in the West.

1/ Average price received by farmers.

The concept of break-even prices is based on the substitution of upland for American-Egyptian cotton or vice versa in the Western States where American-Egyptian cotton is produced. Such substitution means that farmers would plant the most profitable type of cotton in any year. However, acreage allotments for upland cotton in Arizona during the 1930's restricted the acreage of upland cotton that could be planted in that State. Therefore, American-Egyptian, which was considered the next most profitable crop, was planted on land that might otherwise have been planted to upland cotton. During the 1930's production of American-Egyptian cotton was stimulated by acreage allotments for upland cotton.

In 1937, when there were no acreage allotments, the acreage planted to upland cotton in Arizona increased sharply and that planted to American-Egyptian cotton decreased almost as sharply. Acreage of the upland variety increased by about 64 percent from 1936 and acreage of American-Egyptian decreased by 45 percent. With the re-establishment of acreage controls on upland cotton in 1938, production of American-Egyptian again increased while acreage of upland decreased. Acreage planted to American-Egyptian cotton continued to increase because of a combination of favorable prices and acreage controls through 1941, except for 1939 when acreage planted to this variety declined slightly.

In an effort to stimulate production of American-Egyptian cotton for use by the military forces, the United States Department of Agriculture supported the price of the 1942 crop through a purchase program of 43.25 cents a pound

on grade No. 2, 1-1/2 inches in staple length. This purchase program apparently had the desired effect and the July 1 acreage in cultivation to American-Egyptian cotton reached the highest point since 1920--192,900 acres.

Although a CCC purchase program and a loan program were in effect for the 1943 crop of this cotton, acreage decreased about 27 percent from the 1942 peak.

Acreage allotments were removed from upland cotton after 1943 and area planted to American-Egyptian cotton dropped to less than 15,000 acres and remained below this point until 1950. Although CCC loans were available for American-Egyptian cotton during the entire period, actual prices were below break-even prices in 4 of the 6 years between 1944 and 1949, inclusive.

In 1950 acreage allotments were established on upland cotton. As a result, acreage in cultivation to American-Egyptian cotton on July 1 increased from 5,700 acres in 1949 to 104,600 acres in 1950. There were no acreage allotments in 1951 and the area of American-Egyptian dropped to 64,400 acres. It would probably have dropped further except that a purchase program, instituted by the Commodity Credit Corporation, averaged \$1.04 a pound for grade No. 2, 1-1/2 inches in staple length. This purchase price was raised to \$1.07 in 1952 and American-Egyptian increased to 104,200 acres.

Cultivation of additional land for production of cotton in Arizona, the principal American-Egyptian producing State, has influenced production of this cotton. Successive record peaks of acreage in cultivation to all types of cotton in Arizona were reached in 1937, 1949, 1951, and 1952. When acreage quotas were imposed on upland cotton after 1937 and in 1950, the new cotton land had to be diverted to other uses. Consequently the acreage of American-Egyptian cotton increased above the acreages of the preceding 3 or 4 years. The introduction of new land introduces a variable which makes difficult mathematical analysis of the response of American-Egyptian acreage to the various factors that affected it.

In 1952, Public Law 585 was passed by the 82d Congress. This law provides for mandatory price supports for extra-long-staple cotton, including American-Egyptian, and for acreage allotments and marketing quotas on extra-long-staple cotton. When a marketing quota is proclaimed, it must be 30,000 bales or more. This provision means that acreage allotments must be large enough to permit the production of 30,000 bales.

There are to be no marketing quotas or acreage allotments for the 1953 crop. However, a production goal of 39,500 acres and 30,000 bales has been announced for 1953. These figures are 38 and 32 percent, respectively, of the 1952 figures.

This law may offset the shift of acreage from upland to American-Egyptian cotton in the future. However, production from each crop from 1944 to 1949 was well below the 30,000-bale minimum marketing quota specified in Public Law 585. (See table 4). If these years represent the level at which production of American-Egyptian cotton will stabilize in the absence of stimulated production for defense purposes, the law may affect production of this cotton very little.

CONSUMPTION

Consumption of American-Egyptian cotton has varied widely from year to year, particularly during the postwar years. The factors that cause this variation are difficult to assess as this cotton comprises only a small part of the consumption of extra-long-staple cotton in this country. From 1945 through 1950 it averaged only about 10 percent of the consumption of extra-long-staple cotton other than upland. In 1950 the American-Egyptian variety comprised about 22 percent and in 1949 approximately 2 percent of the consumption of extra-long-staple cotton other than upland. (See table 4).

Extra-long-staple cotton is used primarily in industrial sewing thread, fine goods such as broadcloth, organdy, and voiles, typewriter ribbons, lace, certain types of knitting yarns, and wire insulation. ^{7/} In 1949, about 59 percent of the extra-long-staple cotton consumed in this country went into industrial sewing thread. ^{7/}

The quantity of American-Egyptian cotton consumed depends upon the domestic mill demand for all extra-long-staple cotton; the relative prices of American-Egyptian, Peruvian Pima, and Egyptian Karnak; and, perhaps most important, the relative quality of the three growths. In the past, producers of industrial thread and other extra-long-staple products have preferred the quality characteristics of Egyptian cotton to those of American-Egyptian. ^{8/}

The newer varieties of American-Egyptian cotton, Amsak and Pima 32, are reported to have more desirable quality characteristics than S x P. However, insufficient time has elapsed since their production in quantity was started to judge their acceptance by mills in relation to Karnak. Tests of the performance of Karnak, Pima 32, and Amsak cotton have been made. These results are shown in table 2.

Results of these tests indicate that yarn spun from Karnak cotton has a better appearance and fewer neps than yarn spun from Pima 32 or Amsak cotton. However, yarn spun from Pima 32 and Amsak cotton was stronger. Amsak cotton yielded less waste than either of the other varieties and Pima 32 gave less waste than Karnak at a card-production rate of 3.5 pounds or less an hour.

During a large part of the 1951-52 season, the price of Egyptian cotton was higher than the price of American-Egyptian (table 12). This relationship may partially account for the large quantities of American-Egyptian cotton which were consumed by mills in this country in relation to the quantity of Egyptian cotton consumed. Since April 1952, this price relationship has been reversed and from August through December 1952 consumption of American-Egyptian cotton was only about 22 percent as large as consumption of Egyptian cotton. Consumption of American-Egyptian was about 54 percent as large as consumption of Egyptian cotton in 1951-52.

Apparently future consumption of American-Egyptian cotton will depend upon the relation of its price to that of imported Egyptian cotton and upon whether the quality characteristics of Ameek and Pima 32 are good enough to offer serious competition to Egyptian Karnak.

QUOTAS AND IMPORT DUTIES

Over the last two decades, import duties and quotas have been maintained on cotton 1-1/8 inches and longer which is imported into the United States. These duties and quotas affect the supply and price of cotton in the United States which competes with American-Egyptian cotton.

The first import quota on long-staple cotton (1-1/8 inches and longer) was established as country quotas totaling 45,656,420 pounds, effective September 20, 1939. This is equivalent to approximately 95,000 bales. Since that time the quota has been modified from time to time. On December 19, 1940, the quota on cotton 1-11/16" or longer was suspended. On July 29, 1942, the sum of country quotas was made a global quota with no separate quota for any country. A supplemental quota of 23,094,000 pounds of cotton 1-3/8 inches and longer for the quota year 1946-47 was opened June 16, 1947. A supplemental quota of a maximum of 18,000,000 pounds for the quota year 1947-48 was opened July 21, 1948. The opening of the quota year was changed from September 20 to February 1 on September 3, 1949. An interim quota of 16,487,042 pounds for the period September 20, 1949 to January 31, 1950, was announced September 3, 1949. A supplemental quota of a maximum of 7,500,000 pounds of cotton 1-3/8 inches or more but less than 1-11/16 inches and 1,500,000 pounds of harsh rough cotton 1-3/16 inches but less than 1-3/8 inches was announced in October 1950, for the quota year 1950-51. For 1952-53 the quota is approximately 95,000 bales.

During the first 6 years of the long-staple quota, imports were less than the quota, averaging about 40 million pounds from 1939 to 1944. During 3 of the next 6 years supplemental quotas were granted to fill requests from mills. The total quota was filled in only 1 of these 3 years. Throughout the entire history of import quotas, they have been filled in only 6 years and these were the post-World War II years of 1945, 1946, 1948, 1949, 1951, and 1952.

The import duties have affected the price of imported long-staple cotton in the United States. From June 18, 1930, to July 1942, the import duty on cotton longer than 1-1/8 inches was 7 cents a pound. In July 1942, the duty was reduced to 3.5 cents. In October 1951, the duty on cotton 1-11/16 inches and longer was reduced to 1.75 cents a pound, but the duty on cotton 1-1/8 to 1-11/16 inches remained at 3.5 cents.

PRICES

In discussing supply and consumption the effect of prices on these phenomena was emphasized somewhat. In the absence of price supports, supply and consumption in turn would probably influence strongly the price farmers receive for American-Egyptian cotton. However, except for the 1950 crop, a price-support program has been in effect for each American-Egyptian crop since 1942. These support prices have in large part determined the price of the cotton.

Public Law 585 makes support prices for domestically produced extra-long-staple cotton mandatory unless producers disapprove marketing quotas. All crops after the one planted in 1953 will have support prices computed in the same way as the support prices for upland cotton.

For the 1953 crop, the law states, "the level of price support which shall be made available to cooperators for extra-long-staple cotton of the 1953 crop--shall be at a level bearing the same relationship to the level of price support determined for American Upland cotton as the average farm price for extra-long-staple cotton during the period 1936-42 inclusive, bore to such price for American Upland cotton."

In line with this provision, on January 14, 1953, the Department of Agriculture announced that the 1953 crop of extra-long-staple cotton would be supported at a price level 2.4 times the level at which upland cotton is supported. The varieties to be supported are American-Egyptian, Sealand, and Sea Island. On February 26, the minimum average price-support levels were announced at 74.52 cents a pound for American-Egyptian and 56.22 cents for Sea Island and Sealand.

1/ Exports of Sea Island for 1911-20 in bales of 500 pounds. No data readily available for 1921-28. Since January 1, 1929, data include "Pima and Sea Island" and are in running bales.

2/ American in running bales, and foreign in equivalent bales of 500 pounds.

3/ Less than 500 bales.

4/ Preliminary.

Totals were made before figures were rounded to thousands.

Compiled from records and reports of the Bureau of the Census.

Grade 2,	1 1/2 inches will average 107.10 cents per pound, PMA, January 4, 1952.							

1/ Base price.

2/ An additional payment of 1.83 cents a pound was announced in May 1944.

3/ Announced by CCC Feb. 10, 1944.

4/ Announced by CCC Aug. 11, 1945.

5/ Announced by Dept. Agr. Aug. 13, 1946.

6/ Announced by Dept. Agr. Aug. 22, 1947.

7/ Announced by Dept. Agr. Sept. 8, 1948.

8/ Announced by Dept. Agr. Sept. 9, 1949.

9/ No purchase or loan program for the 1950-51 crop.

10/ Purchase rate for cotton longer than 1 1/2 inches are identical with rates for cotton 1 1/2 inches long.

Production and Marketing Administration.
