FARM PRODUCTION, DISPOSITION  
AND INCOME FROM CHICKENS  
AND EGGS, 1909-44

July 1953

This bulletin presents a record of the official estimates of the United States Department of Agriculture relating to chickens and eggs for the years 1909-44 inclusive. The statistical series in this bulletin supersede all series published prior to this date. They are comparable to the 1945-49 series published in June 1952. These estimates relate to inventory numbers of chickens on farms January 1, production, disposition, cash receipts and gross income from farm chickens and eggs, and commercial broiler production and income.

Current estimates have been released in mimeographed reports and other publications. They have also been published every 5 years as revised estimates based on the United States Census of Agriculture, but supplies of previous publications relating to years in the 1909-44 period have become exhausted. In general, estimates relating to chickens on farms January 1 are the same as previously published. Estimates of annual egg production are revised in the 1940-44 period for Oregon and the United States. Annual rates of lay per layer on hand during the year for the period 1925-30 are published for the first time in this bulletin. Estimates of the number of pounds of chickens produced, consumed on farms where produced and sold were not published prior to 1940. Estimates for these items have been prepared for the years 1924-39 and are published for the first time. Prior to 1940 the average price per head sold was used for computing income. Estimates of average weight per bird and of price per pound have been substituted for the series on average price per head in computing income.

A classification of farm chicken sales into young and mature chickens, showing for each class, the number sold, average live weight per bird and pounds sold, which began in 1936, have been carried back to 1929. A revised series of annual farm chicken and commercial broiler prices 1934-44 are shown in this report. These revised price series have been used to recompute new income figures for the years 1934-44. Estimates of commercial broiler production and income in 1944 for Nebraska appear for the first time. Estimates of California broiler production in 1944 are revised to make them comparable with the 1944-49 series published in June 1952. Estimates of total sales and cash income from farm chickens and commercial broilers combined by States have been computed for the years 1934-44 and published here for the first time.

The estimates shown in this publication are believed to indicate within reasonable limits of accuracy the actual number of farm chickens and the production of chickens and commercial broilers; and, with greater accuracy, the direction and extent of the changes from year to year.

The explanations on the following pages are intended to cover only the source and extent of the data used in making these estimates. For detailed explanations of the methods used in making these estimates refer to Miscellaneous Publication No. 703, The Agricultural Estimating and Reporting Services of the United States Department of Agriculture.

---

1/Prepared by E. Smith Kimball, Paul W. Smith and Robert F. Moore, Agricultural Statisticians, with the assistance of the State Agricultural Statisticians and under the general direction of A. V. Nordquist, Head, Division of Livestock and Poultry Statistics.

## Farm Chickens and Eggs

Inventory Numbers: Estimates of numbers of chickens on farms January 1 are based primarily upon the 5-year census enumerations. These enumerations were first adjusted for changes between January 1 and the average date of enumeration in each State. These estimates cover only farm flocks as defined and enumerated by the United States Census. Estimates of change in numbers from year to year are based on rural carrier surveys made in December each year in cooperation with the Post Office Department through rural mail carriers, covering about 150,000 livestock and poultry farms, and on changes in flocks belonging to about 25,000 regular crop reporters.

Non-farm Flocks: No official estimates are prepared for non-farm flocks. Statistics in this publication do not include non-farm flocks. The number of chickens in non-farm flocks is assumed to be about 10 percent of those in farm flocks and the production of chickens and eggs by non-farm flocks in about the same proportion. By geographic regions, non-farm flocks are assumed to be the following percentages of farm flocks: North Atlantic 15 percent, East North Central 10 percent, West North Central 6 percent, South Atlantic 13 percent, South Central 11 percent, and the West 6 percent.

Chickens Raised: Estimates of numbers of chickens raised on farms are based on an annual survey, covering about 150,000 flocks from all parts of the country, made in June each year, in cooperation with the Post Office Department through rural mail carriers, as well as returns from about 25,000 regular monthly crop respondents reporting young chickens on farms June 1 and chicks hatched after June 1 on hand September 1. Estimates based on the above information are checked against the number of baby chicks produced by commercial hatcheries for farm flock replacements less allowance for death loss.

After each 5-year census period chickens raised are revised in line with revisions made in chickens on farms January 1, so as to maintain the proper relationship between chickens raised during the year and chickens on hand at the end of the year.

Sales: Sales of chickens and eggs are computed by subtracting farm utilization from estimated production. These estimates of sales are checked so far as possible against the available data of commercial movement and of consumption off farms.

Prices: The value per head of chickens on hand January 1 is estimated from the values reported by crop reporters. The average annual prices per pound of chickens, live weight, and per dozen of eggs sold are computed from the monthly estimates of prices received by farmers weighted by the estimated quantities sold each month.

Income: Cash receipts from marketings of chickens are computed by multiplying the pounds of chickens sold by the average price per pound. Cash receipts from marketings of eggs are derived by multiplying the dozens of eggs sold by the price per dozen. Gross income from chickens is the total of cash receipts plus the value of chickens consumed in farm households. Gross income from eggs is the total of cash receipts plus the value of eggs consumed in farm households.

Value of Production: The value of farm chicken production is obtained by multiplying the pounds produced by the average price per pound. It is the value of the net annual farm production in pounds, that is the sum of chickens sold and consumed on farms where produced, plus or minus the change in inventory during the year.

The value of egg production is obtained by multiplying the dozens of eggs produced by the price per dozen.

### Commercial Broilers

Broiler Production: Annual estimates of commercial broiler production are based on weekly chick placement reports in States where such data are available. In States not having the weekly reports the estimates are based on reports from hatcheries and broiler producers--covering broiler production, average weight per bird and price received per pound. Some data are received from dressing plants. Weekly and annual broiler marketing data received from poultry dressing plants in the major broiler areas are used as a check against estimates of broiler production based on chick placements. Commercial broiler production, as shown here, includes broilers consumed in households of producers which is less than 1 percent of total production. Broilers are considered produced in the year in which they are marketed. Therefore, an inventory of broilers on January 1 is not necessary in the process of estimating broiler production.

Broiler Prices: Data on commercial broiler prices are collected in all States on the mid-month prices received inquiry. In commercial broiler areas daily commercial broiler prices, published by the Market News Service, and weekly data obtained currently from poultry dressing plants are used to compute average monthly prices. The marketing data received from plants cover a large part of the broilers produced in these States. The average annual price is computed from monthly prices, weighted by pounds of broilers processed in plants each month. This average annual price is checked against a price computed by dividing total amount paid by processors for broilers during the year by total pounds processed.

In States not making weekly chick placement reports, price per pound received by producers for broilers is obtained monthly on regular or special price inquiries from a large list of broiler producers, dressing plants and other broiler buyers. These average monthly prices are weighted by estimated pounds of broilers sold each month to obtain an average annual price. This annual price is checked against an annual price reported by a large number of producers, supplemented by price data received from poultry dressing plants and other buyers. Data on the average live weight of broilers sold are also collected from producers.

Gross Income from Broilers: Gross income from broilers is computed by multiplying the estimated pounds of broilers produced by estimated annual average price per pound. Gross income and cash receipts as used here are synonymous since broilers consumed in households of producers are less than 1 percent of total production.
