ANIMAL UNITS OF LIVESTOCK FED ANNUALLY  
1909 to 1955

by

R. D. Jennings, Agricultural Economist  
Production Economics Research Branch  
Agricultural Research Service

This publication is a revision of earlier processed reports issued by the Department.<sup>1/</sup> Some changes in procedure have been made which will be described later.

Three sets of animal units are presented in this report: (1) Grain-consuming livestock; (2) roughage-consuming livestock; and (3) grain-and-roughage consuming livestock. Numbers of livestock when converted into animal units provide statistics for comparing livestock numbers with the feed supply. A unit is considered as one milk cow or its equivalent as measured by average rates of feed consumption. Each kind of livestock and poultry is converted into the standard animal unit according to the proportion its feed consumption bears to the consumption of one milk cow. Calculations of each of the three kinds of animal units were made separately. Thus we have grain-consuming animal units for which livestock and poultry numbers are combined by a set of factor weights that represent consumption of concentrate feeds. For roughage-consuming animal units, numbers are combined by a different set of weights that represent the consumption of hay, pasture, and other forage. A third set of weights is used to combine livestock and poultry numbers on the basis of total feed of all kinds used, thus resulting in the third set of animal units, grain-and-roughage consuming animal units.

Animal units are designed to take into account all livestock and poultry fed on farms during a year, not merely those on hand January 1. They represent the total size of livestock operations over a year, using the statistics reported by the Department of Agriculture on the numbers of livestock and poultry of different kinds on farms January 1 and the number raised during the year.

---

<sup>1/</sup> Agricultural Research Service, Animal Units of Livestock Fed Annually, 1909 to 1954, ARS 43-10, June 1955; and Bureau of Agricultural Economics, Animal Units of Livestock Fed Annually, 1919-20 to 1948-49, F. M. 64 revised, Oct. 1949.

The animal units were computed by multiplying the numbers of different classes of cattle, sheep, horses and mules, and hens and pullets, on farms on January 1 in each State, by factors that reflect the feed consumption of these classes for a year. In addition, the number of pigs saved, and chickens and turkeys raised, are multiplied by factors that represent their feed consumption in a year. Thus, the total for a given kind of livestock or of all livestock gives the animal units fed in a year.

Animal units are computed by States, and therefore, the factors used for the various kinds of livestock and poultry may differ from State to State and region to region to reflect differences in average rates of feed consumption (tables 1 to 3). Factors for grain-consuming animal units vary more than for roughage or for grain-and-roughage consuming animal units because rates of grain consumption have a wider range of variability in different parts of the country than do rates of roughage consumption.

The State factors used in computing animal units are held constant over the entire period from 1919 to date regardless of any change that may have occurred in the rates of feeding for the different kinds of livestock. For this reason, changes in the animal units of the different kinds of livestock do not necessarily reflect changes in the aggregate quantity of feed fed. This is especially true for grain-consuming livestock over a period of several years because the rates of feeding grain for some kinds of livestock have changed greatly in the last 20 to 30 years. Horses and mules, for instance, are fed much less grain per head than was true 30 years ago while milk cows are fed much more (table 4). However, year-to-year changes in animal units would usually approximate changes in the average quantities of feed required since they are aggregates of all kinds of livestock, and changes in production per head from one year to the next would usually be small. Over a period of years, animal units measure only a head count of livestock fed. They do not measure the volume of livestock production or the quantity of feed fed, which vary according to production per head and rate of feeding per head in each year.

The base period used for determining the factors used to compute animal units was 1940-45 for all livestock except broilers. The 1950-53 period was used for broilers because of the great growth in this industry since 1945. The State factors for grain-consuming livestock except for broilers are much the same as those used in previous reports of animal units fed annually.<sup>2/</sup> Some changes have been made in factors for some States to bring them more in line with neighboring States. Factors for

1/ The base (1.00) for the factors in this table is the average quantity of grain and other concentrates used by the average milk cow in the U. S. in a year in the period 1940-45. Other livestock which are included in calculating animal units and for which the factors are the same in all States are: Sheep and lambs on feed January 1, 0.12 per head; commercial broilers produced, 0.008 per head. 2/ The factors for heifers and heifer calves kept for milk allow for dairy bulls, so the animal units calculated from columns 1 and 2 may be added to show the total animal units of all dairy cattle. Likewise, factors for "all other cattle" allow for beef bulls and the animal units calculated from the factors in columns 3, 4, and 5, may be added to show the animal units of all beef cattle. In AMS statistics, the number of all bulls (dairy and beef not shown separately), is included in "all other cattle." Therefore, in those States where the number of dairy bulls is a large part of the number of "all other cattle," the factors for "all other cattle" are smaller than in other States. 3/ The number of hogs fed in the feeding year beginning October 1 since 1952 was obtained by adding from 10 to 55 percent of the spring pig crop of the year in which the October 1 in question falls, 100 percent of the fall pig crop of the same year, and from 90 to 45 percent of the spring pig crop of the following year. The percentages vary by States and are given in table 5. For the country as a whole, in a normal year, about 65 percent of the feed for the spring pig crop of a given year is fed before October 1, and 35 percent after October 1. Nearly all the feed for the fall crop of pigs is fed within the feeding year beginning October 1. 4/ Beginning with 1952-53 the factors given in the table were used for heavy turkeys and 0.03 was used for light turkeys.

Table 2. - Animal-unit factors for roughage-consuming livestock fed in a year 1/

1/ The base (1.0) for the factors used in this table is the quantity of all feeds including pasture expressed in feed units used annually by the average milk cow in the U. S. in the years 1940-45. Other livestock for which the factors are the same in all States are: Stock sheep, per head Jan. 1, 0.15; sheep and lambs, per head on feed Jan. 1, 0.074; colts, per head Jan. 1, 0.6; commercial broilers, per head produced during year, 0.002; turkeys, per head raised during year, 0.02; goats clipped, per head 0.15.

Table 4. - Concentrates fed per head, selected kinds of livestock,  
United States, 5-year averages, 1920-24 to 1950-54

Year beginning October 1	Milk cows	Horses and mules, 2 years old and over	Hens and pullets Jan. 1
	<u>Pounds</u>	<u>Pounds</u>	<u>Pounds</u>
1920-24-----	1,010	2,287	48
1925-29-----	1,062	2,243	52
1930-34-----	989	1,829	50
1935-39-----	1,105	1,731	53
1940-44-----	1,329	1,709	66
1945-49-----	1,468	1,539	77
1950-54-----	1,574	1,359	86

both heavy and light turkeys are included.

A change has also been made in the method of computing the number of hogs fed in a year, beginning in 1952. Data show that pigs in recent years are being farrowed earlier and the feeding period is being shortened. A much smaller percentage of the spring pig crop is on hand the following January 1 than formerly. The percentage of the total feed fed to spring pigs that is fed after October 1 is smaller than it used to be. The percentages used in recent years are given in table 5. The estimate of hogs fed in the feeding year beginning October 1 in a particular State is obtained by adding from 10 to 55 percent of the spring pig crop of the year in which the October 1 in question falls, 100 percent of the fall pig crop of the same year, and from 90 to 45 percent of the spring pig crop of the following year. The percentages vary by States as shown in table 5. For the United States, about 35 percent of the total feed fed to spring pigs now comes after October 1 compared with 55 percent

Table 5. - Estimated percentage of feed for spring pig crop that is fed after October 1, by States, 1919-51 and 1952-55

before 1952. Largely because of the smaller factor used for broilers, the changes made have resulted in slightly fewer animal units of grain-consuming livestock, especially in recent years.

A significant change has been made in the factors used for computing roughage-consuming animal units and grain-and-roughage consuming animal units. This change was made for young cattle, both dairy and beef, and for colts. Previous factors were found to be not large enough to take care of the nutrients required for growth so the factors were increased. This resulted in an increase in total roughage-consuming animal units of 20 percent or more. The same type of change resulted in about 10 percent more grain-and-roughage consuming animal units.

#### Trends in Animal Units by Regions Since 1920

To show trends, States were grouped into regions as follows:

New England - Maine, New Hampshire, Vermont, Massachusetts, Rhode Island, and Connecticut

Lower Northeastern - New York, Pennsylvania, New Jersey  
Delaware, and Maryland

Corn Belt - Ohio, Indiana, Illinois, Iowa, and Missouri

Lake - Michigan, Wisconsin, and Minnesota

Northern Plains - North Dakota, South Dakota, Nebraska, and Kansas

Appalachian - Virginia, West Virginia, Kentucky, Tennessee,  
and North Carolina

Southeastern - South Carolina, Georgia, Florida, and Alabama

Delta - Arkansas, Mississippi, and Louisiana

Southern Plains - Oklahoma and Texas

Mountain - Montana, Idaho, Wyoming, Colorado, Utah, and Nevada

Southwestern - New Mexico and Arizona

Pacific - Washington, Oregon, and California

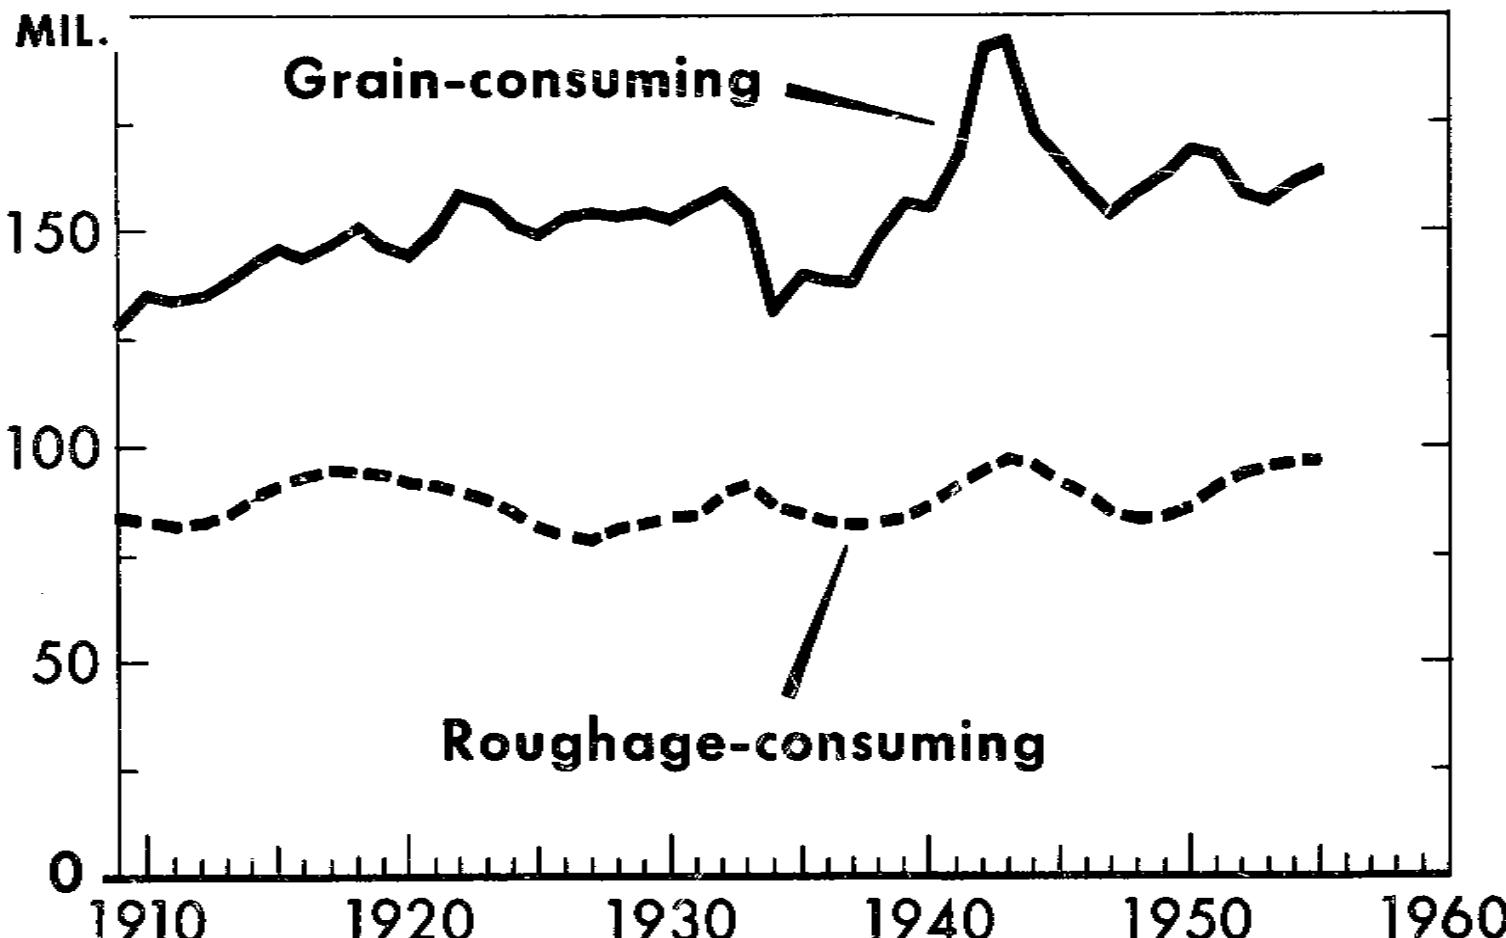

In the United States, especially in the Northeast, the Corn Belt, and the Lake States, numbers of grain-consuming livestock (including poultry) have tended to increase relative to roughage-consuming livestock in the last 35 years. They have tended to decrease relative to roughage-consuming livestock in the Northern Plains and in the Southern Plains, especially in the last 10 years (figures 1 to 5). The number of grain-consuming animal units shows an upward trend but also a wide variation from the drought years of the thirties to the World War II peak. It shows an upward trend in most regions except the Plains and Mountain States.

Animal units of roughage-consuming livestock show a cyclical variation mainly owing to changes in number of beef cattle. At present, the number is nearly as high as in 1943-44 and a little higher than at the previous high points of 1933-34 and 1917-18 (fig. 1). There has been little if any uptrend in roughage-consuming animal units for the country as a whole such as there has been in grain-consuming livestock. The number is higher than at previous peaks in the South, the Appalachian region and the Pacific States. It is somewhat lower than wartime peaks in the Corn Belt, Lake States and Northern Plains, and much lower in the Southern Plains and Southwest. (See fig. 6).

The number of grain-consuming animal units in 1955 was only about 14 percent larger than in 1920, but the number excluding horses and mules was 36 percent larger (table 6). In grain-consuming livestock the striking change in the last 35 years in the United States is the decrease in importance of horses and mules and the increase in meat animals and poultry. Meat animals and poultry now account for 80 percent of grain-consuming livestock (table 7). Poultry now account for over half the grain-consuming livestock in the Northeast and Pacific States and over a third in the Appalachian region, the South and the Southern Plains. The percentage of animal units of poultry has been increasing in New England while that of dairy cattle has been decreasing. Poultry have been increasing in importance in the last 10 to 15 years in several areas because of the growth of the broiler industry. Hogs and poultry add up to two-thirds of the grain-consuming animal units for the country as a whole.

The total of roughage-consuming livestock is no larger than at previous high points in the cycle (table 8), but beef cattle have replaced horses, mules and sheep in the roughage-consuming livestock in the last 2 to 3 decades. The number of beef cattle is nearly half again as high as it was at previous high points; the number of dairy cattle has been relatively constant for 25 years except for the war years, and sheep numbers are now about 60 percent of their high level during the 1930's and

early 1940's. The number of horses and mules has gone down steadily since 1920, and in 1956 there were only one-seventh as many as in 1920. Beef cattle have increased greatly in importance as roughage-consuming livestock in all parts of the country except New England in the last 5 to 10 years (table 9). During this period in most areas the number of dairy cattle has held about the same but the number of beef cattle has increased greatly. In the Corn Belt and Great Plains there has been a decrease in the number of dairy cattle as well as a very large increase in beef cattle. In the Southern Plains, beef cattle account for nearly three-fourths of roughage-consuming livestock where in earlier years around half was nearer the average. The same tendency prevails in the Northern Plains, the Mountain States, and the Southwest. In the South, beef cattle now make up over 60 percent of the forage-consuming animal units and dairy cattle 25 to 30 percent. Numbers of dairy cattle in the United States have about held their own since before the war but now there are twice as many beef cattle. About 56 percent of the roughage-consuming livestock in the Nation now are beef cattle compared with 32 percent in 1940.

The numbers of different kinds of livestock are combined by a set of weights representing total feed per head (grain and roughage) in the years 1940-45 and the data are shown by kinds and years for the United States in table 10. Cattle now are over two-thirds of the total. In the period 1909-19 horses and mules were over 20 percent of the total. Tables 11, 12, and 13 show the three kinds of animal units by States from 1919-20 to 1955-56. Tables 6, 8, and 10 carry the figures back to 1909-10 for the United States only.

#### Use of Animal Units Fed

Animal units fed may be used to estimate the concentrates and hay required to carry the probable or assumed number of livestock in the United States in a particular year. Table 14 shows the assumed number of livestock and poultry for 1956-57 and the calculated number of animal units to be fed. In table 15 the concentrates fed per animal unit are listed for each year back to 1926. From the years 1950-54 it may be estimated that 0.79 ton will be fed per animal unit in 1956-57 or 127.5 million tons for the 161,388,000 grain-consuming animal units calculated in table 13. If later estimates show that a different number of livestock is probable, then the calculation can be revised.

Similarly, the hay disappearance may be estimated by multiplying the roughage-consuming animal units in 1956-57 (96.4 million) by 1.15 tons of hay per unit which is the average disappearance for 1951-55 shown in

Table 14. - Calculation of animal units, United States, for the year beginning October 1, 1956

Livestock	Number	Animal units					
		Grain-consuming		Roughage-consuming		Grain-and-roughage consuming	
		Factor	Number	Factor	Number	Factor	Number
	1,000		1,000		1,000		1,000
	units		units		units		units
On farms January 1:							
Cattle:							
Milk cows -----	23,300	1.02	23,766	0.99	23,067	1.00	23,300
Milk heifers and heifer calves-----	11,600	.344	3,990	.782	9,071	.63	7,308
Beef cows -----	26,000	.167	4,342	.975	25,350	.76	19,760
Cattle on feed-----	5,700	2.00	11,400	.483	2,753	.86	4,902
Other cattle-----	30,800	.154	4,743	.844	25,995	.61	18,788
Stock sheep -----	27,000	.022	594	.20	5,400	.15	4,050
Sheep and lambs on feed-----	4,200	.12	504	.058	244	.074	311
Horses and mules							
2 years old and over -----	3,460	1.34	4,636	.737	2,550	.88	3,045
Colts -----	190	.15	28	1.0	190	.6	114
Hens and pullets -----	365,000	.0577	21,060	.0012	438	.0154	5,621
Hogs -----	51,000	---	---	.01	510	---	---
Raised during year:							
Commercial broilers -----	1,400,000	.008	11,200	---	---	.002	2,800
Chickens-----	480,000	.018	8,640	---	---	.0043	2,064
Turkeys, large-----	55,000	.07	3,850	.0024	132	.02	1,100
Turkeys, small-----	14,000	.03	420	.0024	34	.02	280
Goats clipped -----	3,100	---	---	.2	620	.15	465
Hogs fed in year -----	1 / 87,380	.712	62,215	---	---	.195	17,039
Total -----	---	---	161,388	---	96,354	---	110,947

1/ Calculated as follows:

Spring pigs 1956, (35% of 53,085)-----	18,580
Fall pigs 1956, (100% of 35,000)-----	35,000
Spring pigs 1957, (65% of 52,000)-----	33,800
Hogs fed in year beginning Oct. 1, 1956 -----	87,380

Table 15. - Feed fed per unit of livestock, United States, 1926-55 1/

Year : beginning : Oct. 1 :	: Concentrates : : Hay	Year : beginning : Oct. 1 :	: Concentrates : : Hay
Year : : Tons	: Tons	Year : : Tons	: Tons
1926-----:	0.68	0.96	1941-----: 0.71
1927-----:	.70	1.17	1942-----: .74
1928-----:	.70	1.11	1943-----: .72
1929-----:	.68	1.07	1944-----: .75
1930-----:	.63	.92	1945-----: .79

1940-----:	.69	1.08	1955-----: .80
1941-----:			1.16

1/ Concentrates per grain-consuming animal unit and hay per roughage-consuming animal unit.

table 14. The estimated hay disappearance thus calculated would be 111 million tons.

Animal units may be used to estimate the change in feed requirements for a State from year to year but with less accuracy than at the national level. No figures are available regularly on the quantity of concentrates fed in a State, so a figure is not available with which to compare the animal units. If the grain-consuming animal units increase 5 percent from one year to another in a particular State, it may be assumed that 5 percent more grain and other concentrates will be required unless other influences affect the result, such as an increase in grain fed per head. Shortages of feed because of drought, or excessive supplies because of unusually good pastures are other things that should be taken into account when estimating the feed required. Year to year changes in feed requirements usually can be more accurately estimated from changes in animal units than those extending over a longer period of time, during which rates of feeding may have changed considerably. For instance, milk cows get a third more grain per head than they did 15 to 20 years ago, and broilers use about a third less feed per head.
