VEGETABLES FOR PROCESSING

Acreage, Production, and Value,
by States, 1949-55
Revised Estimates

INTRODUCTION

In this publication, the Crop Reporting Board presents revised official estimates of acreage, production, and value of the principal processing vegetables grown in the United States. These estimates continue the series published in United States Department of Agriculture Statistical Bulletin No. 132.

The Crop Reporting Board's published estimates of processing vegetables include only those commodities which have a long history in the processed foods field. These are asparagus, green lima beans, snap beans, beets, cabbage for sauerkraut, sweet corn, cucumbers for pickles, green peas, pimiento peppers, spinach, and tomatoes. In recent years, processors, particularly freezers, have been handling increasing quantities of vegetables which were formerly grown only for sale to consumers in the fresh state. Substantial quantities of broccoli, Brussels sprouts, carrots, cauliflower, and other vegetables are now being used by processors. Data for these crops are not included in the Department's statistical program for processing vegetables because, in most cases, it is not practical to determine before the end of the harvest season the quantity of such vegetables that processors will purchase. Since most of these vegetables are purchased on the open market, it is more practical to estimate total production for fresh market and processing in advance of and during the harvest season and prepare utilization estimates after harvest has been completed. For that reason these crops are included in the fresh market vegetable estimates published by the Board. At present, utilization estimates for crops such as broccoli, Brussels sprouts, cauliflower, and carrots, which are included in the fresh market program are not being published.

The Crop Reporting Board's estimates of processing vegetables relate to the operations of commercial processors and do not include vegetables processed in the home or by institutions. The term processing, as used to define these estimates, refers to all methods of food manufacture involving these vegetables except dehydration. Estimates of cabbage refer only to quantities used for sauerkraut, and estimates of cucumbers are restricted to quantities used for pickles and pickle products.

Production estimates of processing vegetables represent the total quantity of these raw products purchased or grown by commercial processors. About 90 percent of the production of these processing vegetables is grown by or under contract to processors. The proportion of this controlled production varies between crops and between States. Open-market purchases are an important source of supply for such crops as cabbage, snap beans, and tomatoes--particularly in the East and South. Where such purchases occur, processing vegetable estimates include an allowance for the equivalent acreage from which these open market supplies were harvested.

The season average prices included in statistics on processing vegetables reflect unit value at the grower level and are averages for all varieties, grades, and methods of sale. Differences in varieties, quality, grading, and buying practices contribute to price variations between States and years for individual crops. Processing vegetable price statistics reflect changes in these variables as well as fluctuating price levels.

The estimates published on processing vegetables are based largely on current reports from commercial processors in the United States. These data are supplemented by information furnished by State agricultural statisticians and cooperating State agencies. Estimates for each crop are reviewed annually, using check information such as trade association reports on canned and frozen packs and inspection records. A review of all estimates for the 7 years in this series has recently been completed using these data and acreage information from the 1954 Census of Agriculture. Necessary revisions have been incorporated in this publication. These data may, therefore, differ from those previously published, but the few revisions made were minor.

In an appendix to this publication are United States production statistics for both fresh and processed vegetables for 1919-55.

Table 1--Planted acreage of principal processing vegetables, United States, 1949-55

Crop	1949	1950	1951	1952	1953	1954	1955

APPENDIX

The tables in this appendix contain revised estimates of United States production of vegetables for fresh market and processing and of melons for the years 1919-55.

The production estimates for each of the 11 principal processing vegetables correspond to those published in United States Department of Agriculture Statistical Bulletin No. 132 and in this publication. However, total production of the 11 crops has been adjusted to include allowances for pimiento peppers in 1919-25 and green lima beans in 1919-28, as separate estimates were not made for these two crops in those years. This series of data is limited to the following crops, which have been most important in the processed foods field in this period: asparagus, green lima beans, snap beans, beets, cabbage for sauerkraut, sweet corn, cucumbers for pickles, green peas, pimiento peppers, spinach, and tomatoes. This is not a complete record of vegetables used by commercial processors. For vegetables other than the 11 listed above, quantities used by processors are included in the production estimates listed under the fresh market group.

The series of production estimates for fresh market vegetables and melons is presented by crops for the principal commodities. A separate estimate is made for the total production of minor crops not estimated individually. These are estimates of total commercial production in all States. Estimates for commodities for which processing estimates are published separately relate to fresh market production although quantities dehydrated are included in some years. For other commodities, these production estimates are dominated by quantities produced for sale to consumers in the fresh state but they also include production for processing where it occurs. Most important in this group are broccoli, Brussels sprouts, carrots, and cauliflower.

The fresh market vegetable estimates in this appendix differ from those which the Crop Reporting Board issues monthly. The monthly reports contain detailed estimates by seasons for principal fresh market vegetables in the major producing States. They do not provide complete coverage of these commodities because there are some States in which production of these vegetables is not large enough to justify preparation of estimates. Some of the less important commodities are not estimated separately for the same reason. The regular estimating program for processing vegetables, fresh market vegetables, and melons by seasons and States, accounts for about 92 percent of the total commercial vegetable production in the United States.

Table 25.--Production of principal processing vegetables, United States, 1919-55

Year	Asparagus	Green Lima Beans	Snap Beans	Beets	Cabbage for sauerkraut	Sweet Corn
	Tons	Tons	Tons	Tons	Tons	Tons
1919	25,740	5,000	39,500	20,000	47,500	587,500
