VEGETABLES FOR FRESH MARKET

Acreage, Production, and Value, 1949-55
Revised Estimates, By Seasonal Groups and States

In this publication the Crop Reporting Board presents revised official estimates of acreage, production, and value of the principal fresh market vegetable crops, melons, mint for oil, and strawberries by seasonal groups in the major producing States for the years 1949-55. These estimates continue the series published in United States Department of Agriculture Statistical Bulletin No. 126, titled Commercial Vegetables for Fresh Market, Acreage, Production and Value, 1939-50. Vegetable estimates for 1939-55 relate to total commercial fresh market production of these crops in the States included. Fresh market vegetable estimates published by the Department for 1918-38 are not strictly comparable with those for 1939-55. In the earlier period, estimates were frequently made only for well-recognized commercial areas from which substantial quantities were shipped--usually by rail--to distant terminal markets. In many States, local-market or market garden areas near large population centers were excluded from these 1918-38 estimates. This feature makes this early series less complete than that for 1939-55 in many States.

The term "fresh market" has a dual meaning when it is used in describing vegetable estimates. In a strict sense it applies to the fresh-market production of a group of crops which also have a long history as processed vegetables. This group includes asparagus, snap beans, green lima beans, beets, cabbage for sauerkraut, sweet corn, cucumbers for pickles, green peas, spinach, and tomatoes. The Board publishes separate estimates of acreage, production, and value for the quantities of these vegetables grown for sale to commercial processors.

The term "fresh market" also describes a group of vegetables and melons which were formerly grown exclusively for sale to consumers in the fresh state. In recent years substantial quantities of crops such as broccoli, Brussels sprouts, carrots, cauliflower, garlic, kale, and onions have been used for processing and this production is included in the Department's "fresh market" estimates of these crops. These commodities are not included in the Board's estimates of processing vegetables because it is not practical to determine processors' purchases until the end of the harvest season. Since such a large proportion of these vegetables is purchased on the open market, it is more practical to estimate total production for fresh market and processing in advance of and during the harvest season and prepare utilization estimates after harvest has been completed. Utilization estimates for fresh market crops such as broccoli, Brussels sprouts, cauliflower, and carrots have not been published.

The seasonal nature of the production of vegetables and melons for fresh market and their perishability created a need for information on supplies available during specific periods of the year to facilitate orderly marketing. Vegetable and melon estimates for the 28 principal crops are

classified by States according to the season or period within the season when the bulk of each crop is usually harvested. The forecasts and estimates of acreage and production provide a measure of supplies available in specific seasonal periods. The seasonal groupings used are as follows:

SEASONAL GROUPS AND SUBGROUPS USED FOR VEGETABLE AND MELON CROPS

(Dates refer to period of most active harvest)

Classifications most commonly used

Winter: January, February, March	Early Summer: July 1-August 15
Spring: April, May, June	Late Summer: August 16-September 30
Early Spring: April 1-May 15	Fall: October, November, December
Late Spring: May 16-June 30	Early Fall: October 1-November 15
Summer: July, August, September	Late Fall: November 16-December 31

Classifications used for certain short-season crops

Early Spring: April	Early Summer: July
Mid-Spring: May	Mid-Summer: August
Late Spring: June	Late Summer: September

The seasonal patterns of harvest in all States do not correspond exactly to the periods designated. There is overlapping in the marketing seasons for individual crops, and weather frequently disturbs normal harvesting schedules. Consequently, the classifications employed are frequently less precise than the dates indicate.

Estimates contained in this publication are based primarily on information and data secured by State Agricultural Statisticians from thousands of growers and others associated with the production and marketing of vegetables and related crops. Data secured from other public agencies on the acreage, movement, and sale of these crops are also used. At 5-year intervals, the Bureau of the Census makes its Census of Agriculture and these data are considered in establishing acreage levels in census years. Estimates for 1949-55 have recently been reviewed using census acreage data and other material which has become available since the original estimates were prepared. Revisions in individual estimates have been made where necessary and some of these data differ from those previously published.

Detailed estimates of acreage, production, and value of 28 crops grown in principal producing States shown on succeeding pages and included in regular reports issued by the Department, provide basic statistics for about 81 percent of the national commercial production of the vegetables and melons grown primarily for fresh market sale. Estimates of total commercial vegetable and melon production for the United States are included in the appendix of this report.

APPENDIX

The tables in this appendix contain estimates of total commercial production of all vegetables for fresh market and processing, strawberries, and melons in the United States for the years 1919-55. Also included are estimates of production of mint for oil in 1935-55. These data relate only to commercial production and do not include farm and nonfarm gardens.

The production estimates for fresh market vegetables, strawberries, and melons in this appendix are more comprehensive than the regular estimates published in the body of this bulletin which relate only to principal crops in the major producing States. The Crop Reporting Board's regular reports contain detailed estimates by seasons and pertain only to those States which are of substantial commercial importance in the fresh market production of each of the principal crops. In these reports, it is not practical to include estimates for individual crops in those States in which production is unimportant. For that reason, the Board's regular fresh market vegetable reports do not represent total United States production for the crops included. The fresh market estimates in this appendix provide this information for all States and crops.

Included with the United States estimates of fresh market vegetable production in this appendix is a series on the aggregate production of vegetables for which separate data by crops are not available. These are largely minor vegetables which are not important enough nationally to justify preparation of detailed estimates.

In the fresh market group, estimates for commodities for which processing estimates are published separately relate only to production for fresh market, although quantities dehydrated are included in some years. For other vegetables and melons, these production estimates are dominated by quantities produced for sale to consumers in the fresh state but they also include production for processing where it occurs. Most important crops in this group are broccoli, Brussels sprouts, carrots, and cauliflower.

The production estimates for each of the 11 principal processing vegetables correspond to data regularly published for these crops. Processing vegetable estimates are complete for the crops, States, and years included. However, the series of processing vegetable data in this appendix are limited to the following crops which have been most important in the processed foods field in this period: Asparagus, green lima beans, snap beans, beets, cabbage for sauerkraut, sweet corn, cucumbers for pickles, green peas, pimiento peppers, spinach, and tomatoes. This is not a complete record of vegetables used by processors. For vegetables other than the 11 listed above, quantities used by processors are included in the fresh market production estimates.

The regular program of estimates for processing vegetables, fresh market vegetables, and melons by seasons and States accounts for about 92 percent of the total commercial production of these crops in the United States.

Seasonal estimates for strawberries in the principal producing States now account for about 99 percent of the total production of this commodity.
