TREE NUTS

By States, 1954-59 -- Revised Estimates
Production, Use, and Value

This publication presents statistics by States on production, farm disposition, price, value, and utilization of sales of almonds, filberts, pecans, English or Persian walnuts, and tung nuts for the crop years 1954 through 1959. These statistics are revised where necessary on the basis of the 1959 Census of Agriculture and check data not previously available.

For the benefit of those who are interested primarily in a short historical series of U. S. totals, tables are included which show U. S. statistics for 1949 through 1959. Available data by States for 1909-44 are shown in the Crop Reporting Board Bulletin entitled "Tree Nuts, Acreage, Production, Farm Disposition, Value, and Utilization of Sales, 1909-45" issued October 1947. The data for 1944-49 are shown in the Crop Reporting Board Bulletin entitled "Tree Nuts, Production, Farm Disposition, Value, and Utilization of Sales, 1944-51" issued in August 1952. Data for 1949-54 are shown in Statistical Bulletin No. 195 issued in October 1956.

Except where otherwise noted, the season average prices in this report are estimated average returns to growers for all uses and all methods of sale. The season average price shown for the United States is obtained by weighting State prices by quantities sold.

Value estimates in this report cover the marketing season or crop year, and should not be confused with cash receipts for a calendar year.

Production of almonds, filberts and walnuts in commercial quantities is confined to the Pacific Coast States while nearly all pecans come from 11 Southern and Southwestern States. Almond production is limited almost exclusively to California. More than 90 percent of the U. S. filberts are grown in Oregon and most of the balance are grown in Washington. Most of the English walnuts in the U. S. are grown in California and Oregon with California producing approximately 90 percent of the total.

Pecans are native to America, and more than half of the total crop comes from wild and seedling trees. Texas and Oklahoma are the leading States in the production of seedling pecans. Georgia is the principal producer of improved varieties.

Tung nuts are grown near the Gulf of Mexico in Louisiana, Mississippi, Alabama, Georgia, and Florida. These nuts are inedible and are grown only for the production of tung oil used mainly in paints and varnishes.

Prepared by R. P. Handy, George D. Harrell, and Earl L. Park, Fruit and Vegetable Statistics Branch, Agricultural Estimates Division. Primary data were provided by State Statisticians' offices.
