## Used On Crops and Pasture in the United States

1959 Estimates

Statistical Bulletin No. 348

UNITED STATES DEPARTMENT OF AGRICULTURE  
Economic Research Service and Agricultural Research Service

## PREFACE

Periodic information on fertilizer use by crops provides benchmarks that are widely used by public and private agencies and individuals in analyzing trends and in making studies of farm adjustment problems as they relate to changing patterns of fertilizer use. The estimates contained in this report, like those in a similar report for 1954, supply such a benchmark.

COMMERCIAL FERTILIZER USED ON CROPS AND PASTURE  
IN THE UNITED STATES—1959 ESTIMATES

By

D. B. Ibach, J. R. Adams, and Esther I. Fox 1/

This report includes estimates of fertilizer use on individual crops in terms of principal plant nutrients for 1959 by States for the 50 States, for Puerto Rico, and for each of 99 agricultural subregions in the 48 contiguous States (fig. 1). Agricultural subregions reflect major differences in soils, in types of farming, and certain other economic criteria used in designating State economic areas in former census reports. Boundaries of subregions are not contiguous with State lines. Estimates in this report are compiled by State parts of subregions, for each subregion as a whole, for each State and Puerto Rico, and for the United States and Puerto Rico combined.

For purposes of this report principal plant nutrients include nitrogen (N), available phosphoric oxide ( $P_2O_5$ ), and potash ( $K_2O$ ). Comparable data for both 1954 and 1959 are shown by agricultural subregions for corn, oats, wheat, cotton, tobacco, and hay and cropland pasture. Separate estimates confined to irrigated crops are included by States and subregions where the information was available. An earlier report (1954) provided similar estimates by States and groups of States. 2/ That report also contained estimates for 1947 by groups of States. The present report and the report for 1954, plus certain State reports that are based on the same work, are the only publications on fertilizer in which estimates are derived from information obtained from farmers. Other USDA published statistics on fertilizer use refer to distribution by States as reported by manufacturers and dealers.

---

1/ Mr. Ibach is Agricultural Economist, Economic Research Service; Mr. Adams and Mrs. Fox are in Agricultural Research Service, United States Department of Agriculture. They served as national leaders of the project.

The work of developing the estimates was shared by representatives of the United States Department of Agriculture, State Experiment Stations, and State Extension Services in the 50 States and in Puerto Rico. Field staff members of the Farm Production Economics Division, Economic Research Service, and of the Soil and Water Conservation Research Division, Agricultural Research Service, served as leaders for the Department in 44 States and in Puerto Rico. In this, they worked with representatives designated by the State Directors. In six States where field staff representatives for the Department were not available for the work, leadership was assumed by a representative of the State experiment station or extension service. Their work which has made this report possible is gratefully acknowledged. Separate reports have been issued by some States.

2/ Fertilizer Used on Crops and Pasture in the United States—1954 Estimates, Statis. Bul. 216, U. S. Dept. Agr., Agr. Res. Serv., Washington, D. C., Aug. 1957.

Figure 1

The 1959 Census of Agriculture was the second census in which use of fertilizer on individual crops was obtained. Information was obtained for three specified crops for each State. In addition, the fertilizer schedule for all States included questions on fertilizer use on (1) hay and cropland pasture, (2) other pasture not cropland, and (3) all "other" crops. The three individual crops included in the fertilizer schedule for a State were those of major importance there. Crops were also selected so that the aggregate acreage in the sample for all States combined comprised a high proportion of the total U. S. harvested acreage of these crops.

Answers to questions on the fertilizer census schedule were obtained from every fifth farm visited by the census enumerators. Information on quantity of fertilizer used was limited to fertilizer materials and mixtures, classified as to whether in dry or liquid form, but without reference to plant nutrient content. Rock phosphate, basic slag, and secondary and trace materials may not have been included in all instances.

For each crop included in the fertilizer schedule, census data showing the acreage fertilized and the quantity of dry and of liquid fertilizer used, were compiled and sent to each State. Also, the harvested acreage of each crop was compiled and sent to each State work group, along with Department of Agriculture data showing distribution of N, P<sub>2</sub>O<sub>5</sub> and K<sub>2</sub>O for the State as a whole. Using data provided by the census fertilizer schedule as a partial basis, in conjunction with reported distribution of plant nutrients to the State, each work group developed estimates by subregions, showing: (1) non-farm use of each plant nutrient, (2) acreage of each crop receiving any fertilizer, (3) acreage fertilized with each nutrient, and (4) the quantity of each nutrient applied on each crop.

Throughout this report, acres harvested, acres fertilized, tons of plant nutrients, and rates per acre are reported in whole units. The percentage of acreage fertilized is reported to the nearest tenth of a percent, except in table 5 where the percentages have been rounded to whole numbers. Where initial estimates of acreage fertilized, or of nutrient used on a crop amounted to less than 0.5 unit, dashes (---) appear in the table, and rates per acre were computed from the unrounded estimates. Otherwise, rates per acre were computed from rounded estimates. Dashes (---) are also used to indicate no acreage fertilized or no fertilizer used on a crop for which the harvested acreage is shown.

In table 1 (estimates by States), a minus (-) sign for miscellaneous crops in the acreage harvested column indicates the net acreage double cropped at the State level. Where fertilizer was used on miscellaneous crops in any of the subregions or parts of subregions within the State, the gross acreage of miscellaneous crops harvested was used as the divisor in computing the percentage of acreage fertilized. In Hawaii, more acreages of sugarcane, vegetables, wetland taro, and rice, were fertilized than were harvested. This resulted from abandonment, or in the case of sugarcane, the fact that the crop is grown over a 22-month cycle so that it is normal to fertilize more acres than are harvested in a 12-month period.

The acreage of permanent pasture fertilized, by States, was expressed both as a percentage of the acreage of all permanent open pasture and of the acreage of improved permanent pasture in table 1. In table 3, dealing with fertilizer use by subregions on all acres, the acreage of permanent pasture fertilized is expressed only as a percentage of all permanent pasture. However, in tables 2 and 4 which are concerned only with fertilizer use on irrigated crops, the acreage of permanent pasture fertilized is expressed only as a percentage of the improved permanent pasture.

In tables 1 to 4, inclusive, all acreages fertilized relate to the use of each nutrient separately. These are not additive, since as in most cases some acres were fertilized with more than one nutrient. However, for 28 States and Puerto Rico, the net percentage of the harvested acreage receiving any fertilizer is the same as that shown for the nutrient with which the highest percentage of the acreage is fertilized, as indicated in those tables. For 22 States the percentage of acreage of some crops receiving any fertilizer in some State parts of subregions, is greater than the highest percentage indicated for a nutrient in tables 1 to 4. The crops and State parts of subregions involved where this is the case, together with the net percentage of harvested acreage fertilized, are shown in table 5. The following States are those for which reference to table 5 is necessary in order to find the percentage of the acreage of crops shown in that table that received any fertilizer: Arkansas, California, Idaho, Illinois, Louisiana, Michigan, Montana, North Dakota, New Hampshire, New Jersey, Nebraska, New Mexico, Ohio, Oklahoma, Oregon, South Carolina, South Dakota, Tennessee, Texas, Washington, West Virginia, and Wyoming.

Rates of application per fertilized acre shown in tables 1 to 4 were computed by dividing the quantity of the nutrient by the acreage receiving an application of that nutrient. This represents a change from the method used for the 1954 report in which rates were derived by dividing the quantity of each nutrient by the acreage receiving any fertilizer. Estimates of acreages receiving applications of each nutrient separately were not obtained for purposes of the 1954 report. Table 6 includes comparable estimates for both 1954 and 1959 for 6 major crops, by States and agricultural

subregions. In table 6, rates per acre are derived by dividing the quantity of a nutrient by the acreage receiving any fertilizer.

In a few instances the acreage of a crop fertilized in 1959 as shown in table 6 may be greater than the combined acreage fertilized with N, with  $P_2O_5$ , and with  $K_2O$  for the same State part of the subregion (table 3). The reason for this is that acres on which only a material such as gypsum or sulfur was applied were considered as being fertilized.

The national fertilizer crop-use patterns in 1959 and percentage changes from 1954 are shown in figures 2 to 21 for corn, oats, wheat, cotton, and hay and cropland pasture. The data for the maps showing the percentage of harvested acreage fertilized were calculated by dividing the acreage receiving any fertilizer by the harvested acreage. The acreage receiving any fertilizer was also the basis on which the nutrient application rates were estimated.
