CHICKENS AND EGGS

Monthly Egg Production, Layers on Farms, Pullets not of Laying Age, and Rate of Lay, by States and Geographic Regions, Revised Estimates, 1960-64

This publication presents a record of the revised estimates of the Crop Reporting Board of the Statistical Reporting Service relating to hens and pullets of laying age, rate of lay, egg production, and pullets not of laying age. It continues the official series of layers and egg production as shown in "Chickens and Eggs, 1925-44, Statistical Bulletin 125" 1/, "Chickens and Eggs, 1945-50" 2/, "Chickens and Eggs, 1950-55, Statistical Bulletin 174" 3/, and "Chickens and Eggs, 1955-59, Statistical Bulletin 283" 4/. Current estimates have been released in the Monthly Crop Production Report and in an annual publication issued in March each year.

Current estimates of numbers and rate of lay are based primarily on survey returns from farmers and commercial egg producers who report for the first day of each month the number of layers on hand and the number of eggs produced "yesterday", that is, current daily egg production. The revised series by States, Regions and for the United States, are based on a thorough review of the original estimates taking into consideration data from the 1964 Census of Agriculture and other information relating to inventory numbers and rate of lay. Revisions in the January 1 inventory of chickens by States are shown in Statistical Bulletin No. 389, "Livestock and Poultry Inventory, January 1, Number, Value, and Classes, by States, 1961-65."

Number of layers. The average number of layers on hand during the month, by States, is the mean of the estimated number on the first of that month and the first day of the succeeding month. The regional estimates of the total number of layers on the first of each month are made on the basis of the monthly reports of layers on hand. The number of layers on farms January 1 serves as the starting point for these monthly estimates.

1/ U. S. D.A. Bureau of Agricultural Economics, Chickens and Eggs, by States and Geographic Divisions, 1925-44. Statistical Bulletin 125. May 1953.

2/ U. S. D.A. Bureau of Agricultural Economics, Chickens and Eggs, by States and Geographic Divisions, 1945-50. April 1952.

3/ U. S. D.A. Agricultural Marketing Service, Chickens and Eggs, by States and Geographic Divisions, 1950-55. Statistical Bulletin 174. April 1956.

4/ U. S. D.A. Statistical Reporting Service, Chickens and Eggs, by States and Geographic Regions, 1955-59. Statistical Bulletin 283. April 1961.

Rate of lay. The number of eggs laid during the month per 100 layers on hand is the mean of estimated rate on the first of that month and the rate on the first of the succeeding month. By multiplying the estimated daily average by the number of days in the month, the number of eggs produced per 100 layers during the month is obtained. The annual rate of lay per layer is computed by dividing the total eggs produced during the year by average numbers of layers on hand during the year.

Total egg production. The monthly egg production is obtained by multiplying the average number of layers on hand during the month by the number of eggs produced per layer. An estimate of total egg production, for any period of months, is obtained by adding the production of the months involved.

Pullets not of laying age. Potential layers are hens and pullets of laying age plus pullets not of laying age. These estimates are based on information from farmers and commercial egg producers who report the number of layers on hand the first day of each month and their inventory of pullets not of laying age from August 1 through January 1.

The number of pullets not yet of laying age, other chickens, and hens are estimated on October 1 and January 1. These estimates are based on the sample relationship of the various classes to layers on the first of the month. Estimates of pullets not of laying age and potential layers are prepared only by regions and for the United States.
