## FIELD AND SEED CROPS

Production, Farm Use, Sales, and Value  
Revised Estimates, by States, 1959-64

This report presents revised estimates of farm use, sales, and value of field and seed crops for 1959-64, in keeping with revisions of estimated production for this period. These estimates replace those released annually in the reports "Field and Seed Crops -- Production, Farm Use, Sales, and Value."

Estimates of farm use and sales relate to disposition of a given year's production on the farms producing the crop, regardless of time of disposition. Quantities going into Government reseal programs at the end of a current marketing year are generally included in sales. Therefore, reseal grains stored on farms are included in the disposition during the marketing season for the year of production. Estimates of quantities fed to livestock and poultry represent the portion of the year's production fed on the farms that produced the crop; thus, they do not represent total quantities of such crops ultimately used for livestock and poultry feeding. Grain purchased for feed does not enter into these feed estimates; some products shown as "sold" from farms are used for feed and seed on other farms in the same or other States.

For soybeans, peanuts, and cowpeas, neither the total harvested production nor quantities fed to livestock include the quantities "hogged off" on farms. For certain crops, total seed requirements are shown, and for some a further breakdown is made to show homegrown seed. The difference between total seed and homegrown seed would thus represent purchased seed, which is included in the quantity sold. The quantity of grain corn sold and used for feed and seed is shown for all years. For 1959 and 1960, utilization of corn for feed and seed is also computed, based on an equivalent production of all corn, which includes a grain equivalent of corn silage and forage as well as corn for grain.

Quantities of principal feed crops sold and used in the farm household, if any, are estimated directly, and the residual--production less household use and sales--is shown as used for feed and seed. Changes in marketing patterns, dietary habits, and other factors, such as closing of local mill facilities, have reduced the quantity of grains used in the farm household, and estimates of home use were discontinued for most crops starting with 1961. For certain commodities which have virtually no farm use, the entire production is shown as sales. Sales of some commodities are estimated directly from an analysis of survey data on production and sales reported by farmers. For others, special disposition inquiries are made in which farmers report their production of each commodity and the quantities used on their farms for each purpose. Whenever possible, sales have been checked by enumerations, such as reports of processors, or by records of handlings and shipments by rail, truck, and boat.

Midmonth prices are used for computing season average prices for most crops included in this report. The midmonth prices are weighted by the estimated percentage sold each month in computing State season average prices. Crops for which midmonth prices are not available and for which special survey data are used as the basis for season average prices are broomcorn, cowpeas for peas, hops, maple sirup, popcorn, and sugarcane sirup. U. S. and State season average prices for barley, dry beans, corn, flaxseed, oats, rice, rye, sorghum grain, soybeans, and wheat include an allowance for unredeemed loans and purchases by the Government valued at the average loan and purchase rate, by States. The U. S. season average price shown for each crop is computed by dividing the U. S. value of sales by quantity sold. A U. S. season average price weighted by production can be derived by dividing the U. S. value of production by quantity produced.

The season average prices for quantities sold are also used to evaluate total quantities produced and quantities used on farms. Value of sales is computed by applying the unit price to quantity sold during the marketing year. In like manner, value of production and of home consumption is computed by applying the season average price to the quantity produced or used. The value estimates are for the marketing season, or crop year; they should not be confused with cash income, which is calculated on a calendar year basis.

The marketing season for each crop is shown on pages 107 and 108. This bulletin is a continuation of similar data on farm use, sales, and value of field and seed crops contained in Statistical Bulletin No. 311.

1/ Differences between production and production having value are economic abandonment.

2/ Includes 262,000 pounds of Oregon hops paid for but not harvested.

3/ Production having value includes Washington hops harvested but subsequently burned in kiln fires as follows: 1962, 159,000 pounds; 1963, 86,000 pounds; 1964, 297,000 pounds.
