**Egg Price Relationships,
1962-68 -
Selected Markets,
Trading Levels,
Grades, Sizes**

PREFACE

This report on relationships between prices for eggs in various markets, levels of trading, and grades and sizes is based mainly on Federal and State market news monthly average series for 1962-68.

A program of research in egg pricing was conducted during 1966-69 by direction of Congress and under special funds appropriated to the Economic Research Service. This compilation of price series, differentials, and regressions supplements other studies carried out by USDA agencies and 13 cooperating State Agricultural Experiment Stations.

The authors wish to acknowledge the assistance of Pearl Williams and Kathryn Newton, Economic Research Service, in carrying out the statistical analyses included in this report.

SUMMARY

Egg prices in many areas tend to follow closely the changes in such prices as those at wholesale in New York, at the farm level in Iowa, or at the delivered-to-retailer level in New York. In contrast, prices in the Mountain and Pacific Coast regions are not as closely related to New York and Iowa prices. Price differentials between areas, trading levels, and grades and sizes also vary seasonally.

The egg market is nationwide, since eggs are a relatively homogeneous commodity and can move rather freely between various regions in a short time. But prices for eggs are often affected by local conditions as well as by aggregate supply and demand changes.

The egg industry uses base price quotations at several key markets to derive prices at other points. Some base price quotations are closely related at all times, but others do not precisely follow each other. Thus, price relationships are also influenced by the particular base price quotations which are most widely used in each area.

This report contains tables of monthly price series for selected geographical points, different levels of trading, and the more important grades and sizes of eggs moving through marketing channels. It also contains tables of monthly price differentials between selected series for 1962-68. Finally, it summarizes the linear relationships between selected series and their statistical significance on a monthly basis for 1962-67.

**EGG PRICE RELATIONSHIPS, 1962-68—
Selected Markets, Trading Levels, Grades, Sizes**

by

**George B. Rogers and Fred L. Faber, Agricultural Economists, and Ruth J. Irvin,
Economic Assistant, Marketing Economics Division, Economic Research Service**

PURPOSE

The selected egg price series, price differentials, and regression equations in this report should be of use to economists, researchers, price analysts, and trade firms—especially those associated with the egg industry. The report is intended to be a reference on past price relationships and to help suggest those which may be expected in the near future.

SOURCES AND SCOPE OF DATA

Monthly price series used in this report were compiled mainly from annual issues of Dairy and Poultry Market News Statistics, published by the Consumer and Marketing Service, U.S. Department of Agriculture. Only series for which the specifications were relatively unchanged over most or all of the 1962-68 period were selected. The selection also includes only grades and sizes of eggs of major importance in market movements. Geographic and trading level coverage included was as wide as possible consistent with the preceding limitations.

Prices reported by market news services typically represent the results of actual buying and selling. Thus, they may differ to some extent from base price quotations established by private and public agencies. These are widely used by trade firms as a reference for determining prices on a larger volume of transactions. Sometimes erratic short-run fluctuations in price quotations, and in prices based upon them, result from particular pricing mechanisms. Many of these fluctuations are eliminated by comparing monthly averages.

METHODS OF ANALYSIS

Differentials were computed between monthly average and annual average prices for selected price series. These included comparisons between (1) wholesale level prices at New York or Iowa farm prices and other farm and wholesale price series; (2) prices to retailers at New York and other markets; (3) farm and wholesale or price-to-retailer levels of trading in various markets for each size of egg; and (4) prices for large and other sizes of eggs in various markets. Tables 1 to 154 contain the basic price data and tables 155 to 268 the computed differentials.

For selected comparisons, regression equations were computed for each month for 1962-67 (or shorter periods when data for the full 6 years were not available). Tables 269 to 366 show the regression equation ($Y = a + bx$), the value of the correlation coefficient (r), and the level of significance of (r), as determined from standard statistical tables.

GENERAL RELATIONSHIPS

The comparisons in this report are based on monthly average prices because of the availability of a substantial body of data in that form. However, in practice, many significant price changes occur during time periods of shorter duration and/or may involve weeks in 2 adjacent months.¹ Thus, some improvement in relationships might be effected by using time periods different from calendar months.

The market for eggs is basically nationwide. Hence, major changes in aggregate supply and/or shifts in total demand eventually affect prices in all geographic areas. Average price levels thus tend to move up and down together in the long run. But these relationships can be somewhat imperfect over short run and even intermediate time periods, and because conditions vary between major geographic areas.

Year-to-year rates of change in output are not identical in all areas. Moreover, the seasonality of production differs in various areas because of precedent, climate, and varying decisionmaking structures. Shifts in demand may also vary in degree and timing because of localized influences. Moreover, changes in transportation and handling charges can affect price differentials between surplus and deficit areas. Consequently, geographic price differentials may show variation both from year to year and seasonally.

Price differentials between various trading levels in each area reflect the predominant marketing practices. These include the degree to which local output exceeds or is inadequate to meet local needs; the number, size, and geographic dispersion of producing and marketing units; and the length and complexity of marketing channels. Price differentials between trading levels in an area also can change annually or seasonally, depending on changes in marketing services performed, pricing practices, volumes, and the margins which handlers attempt to realize.

Coinciding somewhat with the average age of the Nation's laying flock, aggregate supplies of small and medium eggs are relatively more plentiful in the fall when the largest share of the pullets raised reach laying age. Aggregate supplies of large eggs increase relatively from fall to summer, as do supplies of eggs of extra large size and above. But this pattern is not the same for all areas. Hence, seasonal price differentials between larger and smaller sizes in a given area often vary from the national pattern.

Base price quotations commonly used throughout the egg industry are mostly determined at the wholesale level. Recent discussions have suggested that other trading levels, such as the farm and delivered-to-retailer levels, could be used for determining base price quotations.

New York base price quotations are the most widely used throughout the country. Thus, some of the comparisons in this report tested past relationships between wholesale prices at New York and prices at other points. The farm prices selected for comparison with prices at other points were Iowa prices, since they are representative of values in a major surplus area. Prices to retailers at New York were compared with prices to retailers in other markets, both because of the importance of New York wholesale base price quotations and because the Northeast is the major deficit region in the country.

¹ For example, see the discussion of periods of egg price changes in the New York wholesale market, pp. 9-11, in G. B. Rogers and L. A. Voss, Pricing Systems for Eggs, U.S. Dept. Agr. Mktg. Res. Rpt. 850, May 1969.

New York wholesale prices are closely reflected in farm prices in Iowa and Georgia, wholesale prices in St. Louis, and prices to retailers in Detroit. They are not as consistently related to wholesale prices in Denver, farm prices in Fresno, Calif., prices to retailers in Los Angeles, or farm prices in New England. In New England, brown egg prices often follow a different pattern from white egg prices in New York. Prices in the Mountain and Pacific regions often reflect local conditions on the West Coast rather than changes in prices at New York.

Farm prices in Iowa are closely related to farm prices in Georgia, North Carolina, Kentucky, Mississippi, and Wisconsin, shipping-point prices in the Iowa-Minnesota-Wisconsin area, wholesale prices in Chicago, and prices to retailers in Detroit and Atlanta. Relationships are somewhat less consistent between farm prices in Iowa and Ohio-Indiana and prices of large eggs delivered to retailers in New York. Iowa farm prices are often not closely related to farm prices in the Fresno and Modesto areas of California or the Portland, Oreg., area, or to prices to retailers in Los Angeles.

Prices to retailers in New York are closely related to prices to retailers in Philadelphia, Baltimore, Pittsburgh, major Ohio cities, Detroit, Chicago, Atlanta, and North Carolina cities. Relationships are somewhat less consistent between prices to retailers in New York and those in Southern cities like Birmingham, Ala., Jacksonville, Fla., and Jackson, Miss. They are even poorer between New York and cities in Colorado and in the Pacific Coast States, or between prices to retailers in New York and farm prices in Fresno, Calif.

With few exceptions, relationships are close between wholesale prices and prices to retailers in New York, between New England farm prices and prices to retailers in Boston, and between Georgia farm prices and prices to retailers in Atlanta. On the other hand, relationships between farm prices at Fresno and prices to retailers in Los Angeles are less consistent.

Iowa farm prices for eggs produced under quality and volume incentive programs are often not closely related to prices for breaking stock in the Iowa-Nebraska area. On the other hand, Iowa farm prices for mixed colors from other production are usually closely related to prices for breaking stock in the Iowa-Nebraska area. Relationships between Iowa farm prices for mixed colors from other production and Chicago breaking stock prices are less consistent. Iowa-Nebraska and Chicago breaking stock prices are closely related most of the time.

In most months, prices for breaking stock at Chicago are quite closely related to frozen whole egg prices in New York and Philadelphia, and the latter prices to dried whole egg prices at New York.

The large size of eggs is the one available in greatest volume throughout the year. Consequently, base price determination is likely to be centered around large eggs, and both the trade and consumers are accustomed to using large eggs as a standard of comparison for other sizes.

In many areas of the country, producers are not paid premiums for extra large eggs. It is presumed that prices paid for large eggs reflect the additional returns handlers obtain for extra large. Where premiums over the price of large eggs do exist for extra large eggs at the farm or other levels of trading, they range from under 2 cents to over 2.5 cents per dozen on an annual basis. Seasonally, premiums range from about 0.25 cent to over 5 cents per dozen.

On an annual basis medium eggs bring 5-7 cents less per dozen than large eggs. Seasonally, the discount ranges from less than 1 cent to over 11 cents per dozen.

Small eggs sell for 11-16 cents less per dozen than large eggs on an annual basis. Seasonally, the discount ranges from about 4 to over 25 cents per dozen.

- 1/ Prices paid delivered grading plant adjusted to farm prices 1962 through 1967.
- 2/ Not computed because of insufficient price data.
- 3/ Net prices paid producers for eggs on actual yield graded at packing plant.
- 4/ Prices in 1962 were for mixed colors.
- 5/ Iowa series began in June 1962.
- 6/ Average for less than full year.
- 7/ Prices January through May include eggs produced "under quality and volume incentive programs."
- 8/ January through June are prices paid delivered plant.
- 9/ Prices paid delivered plant 1962-63.
- 10/ Series began January 1963.
- 11/ Series began August 1962.
- 12/ No average computed--less than 6 months data reported.
- 13/ Minimum sale--50 cases, cases included, weighted according to volume and price reported.
- 14/ Minimum sale--3 cases.
- 15/ Series began June 1964.
- 16/ Series began May 1962.
- 17/ Minimum sale--1 unit, weighted according to volume and price reported.
- 18/ Prices prior to July 1966 were for Jacksonville area only, thereafter West Central and Northeast Florida markets.
- 19/ Minimum sale--1 case, commercially graded at Portland, Oregon.
- 20/ Commercially graded, 47 pound average net weight.
- 21/ Commercially graded, 41 pound average net weight.
- 22/ Beginning 1968, minimum 10 percent AA, 75 percent A quality.
- 23/ Commercially graded, 36 pound average net weight.
- 24/ Series began April 1963.

^{1/} Significance level based upon t value statistic.

^{2/} Coefficient was not significant at 0.10.

^{3/} Period covered January through July is 1963-67.

^{4/} January through May period covered is 1963-67.

^{5/} Period covered January through March is 1964-67.

^{6/} Period covered January through May is 1963-66.

^{7/} Period covered 1963-67.

^{8/} Period covered January through May and the month of July is 1963-67.

^{9/} Period covered 1961-67.
