FIELD AND SEED CROPS
Revised Estimates, 1964-69
Production, Farm Use, Sales, and Value

This report presents revised estimates of farm use, sales, and value of field and seed crops for 1964-69 in keeping with revisions of estimated production for this period. These estimates replace those released annually in the reports "Field and Seed Crops -- Production, Farm Use, Sales, and Value."

Estimates of farm use and sales relate to the disposition of a given year's production within the marketing season shown regardless of time of actual disposition. Quantities going into Government reseal programs at the end of a current marketing year are included in sales. Therefore, reseal grains stored on farms are included in the disposition during the marketing season for the year of production.

Estimates of quantities fed to livestock and poultry represent the portion of production fed on farms where produced. These estimates do not represent total quantities used for livestock and poultry feed. Some of the amounts shown as "sold" are used for feed and seed on other farms.

Total seed requirements are shown for certain crops, and a further breakdown made to show the amount of homegrown seed. The difference between total seed and homegrown seed would thus represent purchased seed, which is included in the total quantity sold.

Sales of some commodities are estimated directly from an analysis of survey data in which farmers report production and sales. For others special disposition surveys are made in which farmers report their production of each commodity as well as the quantities used on their farms for each purpose. When possible, sales have been checked by enumerations, such as reports of processors, or by records of handlings and shipments by rail, truck, and boat. The entire production is considered sold for commodities with virtually no farm use.

Midmonth prices are used for computing season average prices for most crops included in this report. The midmonth prices are weighted by the estimated percent sold each month in computing State season average prices. Midmonth prices are not available for broomcorn, cowpeas, hops, peas, popcorn, and sugar crops. For these crops, special survey data are used as the basis for season average prices. The State and U. S. season average prices for barley, dry beans, corn, cotton, flaxseed, oats, rice, rye, sorghum grain, soybeans, and wheat include an allowance for unredeemed loans and purchases by the Government valued at the average loan and purchase rate, by States. The U. S. season average price shown for each crop is computed by dividing the U. S. value of sales by quantity sold. A U. S. season average price weighted by production can be derived by dividing the U. S. value of production by quantity produced.

The season average prices for quantities sold are also used to evaluate total quantities produced, and quantities used on farms. Value of sales is computed by applying the unit price to quantity sold during the marketing year. In like manner, value of production and home consumption are computed by applying the season average price to the quantities produced or used.

Season average prices and value of production including price support payments are also shown for barley, corn, cotton, wheat, and sorghum grain. The U. S. season average price plus price support payments is computed by dividing the U. S. value of production plus price support payments by production.

The marketing season for each crop is shown on pages 108 and 109. This bulletin is a continuation of similar data on farm use, sales, and value of field and seed crops contained in Statistical Bulletin No. 404, May 1967.

1/ Includes allowance for unredeemed loans. 2/ Includes price support payments. Does not include payments for acreage diversion, conservation practices, soil bank, etc. Price per pound in States with nominal production may appear unreasonable as a large proportion of the value consist of price support payments.
