PREFACE

This report presents estimates of the amounts of wood products consumed in nonresidential and non-housekeeping building construction in the United States during 1969. Wood products included are lumber, glued-laminated lumber, plywood, hardboard, particle-board, insulation board, and structural wood-fiberboard. Consumption of these materials is shown by building type (nonhousekeeping, industrial, commercial, religious, educational, hospital, and other), by structural class (wood, steel/masonry, and concrete), by major end use (roof, exterior wall, floor, millwork, and facilitating), and by construction item.

Factors of wood products use are shown per 100 square feet of floor area and per 1,000 dollars of construction value, by building type and structural class.

This is one of a series of studies on wood use conducted under the provisions of the McSweeney-McNary Forest Research Act of 1928, as amended which

authorized and directed the Secretary of Agriculture to cooperate with State and other agencies "in making and keeping current a comprehensive survey of present and prospective requirements for timber and other forest products."

Acknowledgment is made to the more than 1700 architects and contractors who provided building project information consisting of construction cost data and estimates of the amount of wood materials required for the forming of concrete and other facilitating purposes. Within the Forest Service, special appreciation is expressed to Harry Kevich and staff, Architectural Branch, Division of Engineering, Region 5, for performing materials take-off from plans and specifications of buildings in the West Region and to David Neebe, Joseph Morsch, and David McKeever for developing computer programs used for data analysis and computation.

SUMMARY

Nonresidential and nonhousekeeping building construction in the United States during 1969 amounted to 1.6 billion square feet of floor area and \$32.7 billion of construction value. Industrial and commercial buildings made up 64 percent of the floor area constructed and 51 percent of the construction value. Almost three-quarters of the floor area and two-thirds of the construction value of building projects were classified in the steel/masonry structural class. Construction value per square foot of floor area was highest for hospital buildings (\$35.82) and lowest for industrial buildings (\$13.77).

Lumber used in building construction amounted to more than 1.6 billion board feet. Approximately half of the lumber was used in industrial and commercial buildings, and in buildings classified in the wood structural class.

Glued-laminated lumber used in building construction amounted to 192 million board feet. Forty percent went into industrial buildings and only two percent in nonhousekeeping and hospital buildings. Practically all glued-laminated lumber was used in the wood structural class.

Plywood used in building construction amounted to over 974 million square feet (3/8-inch basis). Approximately two-thirds was used in industrial, commercial and educational buildings. About 80 percent of the total

plywood used was almost equally divided between the wood and steel/masonry structural classes.

Of almost 42 million square feet (1/8-inch basis) of hardboard put into building construction, 60 percent was used in educational and commercial buildings, primarily as paneling and millwork. Among the structural classes, steel/masonry took 61 percent of the hardboard.

Approximately 14 million square feet (3/4-inch basis) of particleboard was used in building construction, 58 percent of it in nonhousekeeping and educational buildings, primarily in the form of millwork. Most of the particleboard (61 percent) was used in buildings in the steel/masonry structural class.

More than 80 million square feet (1/2-inch basis) of insulation board was used in construction. Approximately half was put into industrial buildings, and a third into commercial, educational, and nonhousekeeping buildings. Over 92 percent was used as roof insulation. Buildings in the steel/masonry structural class accounted for 83 percent of the total.

Structural wood-fiberboard used in building construction amounted to 185 million square feet (1-inch basis), over half (56 percent) in industrial buildings and under a third (29 percent) in educational buildings. Practically 95 percent of the structural wood-fiberboard went into roof decking. Almost 90 percent of the total was used in buildings in the steel/masonry structural class.

CHARACTERISTICS OF BUILDINGS

The characteristics of nonresidential and nonhousekeeping construction, as indicated by building type, structural class, floor area, and value of construction, are important in determining the requirements for wood products in building construction. Both floor area and value of construction are measurements of construction activity and are available from public and private sources.

The building projects on which this study was based were classified into seven building types—nonhousekeeping, industrial, commercial, religious, educational, hospital, and other—and three structural classes—wood, steel/masonry, and concrete.¹ The seven building types vary in lumber and plywood requirements. This is due to the amount of construction activity among building types, differences in uses of buildings, building code requirements, and preferences of individuals specifying construction materials. The three structural classes grouped those projects having comparable material requirements.

For each project, wood products use was determined by building component and construction item. Building components consisted of roof, floor, exterior wall, interior wall, and millwork. Wood products used for facilitating purposes, such as concrete formwork or other temporary uses were also included as a component of building construction.

FLOOR AREA

Of the 1.6 billion square feet of floor area contained in nonhousekeeping and nonresidential buildings constructed in 1969, one-third was in industrial buildings, almost a third in commercial, and the balance in the five remaining building types, ranging from 15 percent in educational to 3 percent in religious buildings (table 1, fig. 1).

Nearly three-fourths of the floor area of all buildings was in the steel/masonry structural class. The remainder was almost equally divided between the wood and concrete classes. Industrial, commercial, and educational buildings were predominantly steel/masonry construction. A high percentage of religious buildings (63 percent of floor area) was in the wood structural class and hospitals were most often of concrete construction. Ten percent or less of the floor areas in industrial, commercial, and religious projects were in the concrete struc-

tural class and less than five percent of the area of educational buildings was in the wood class.

Floor area, by building type and structural class, 1969

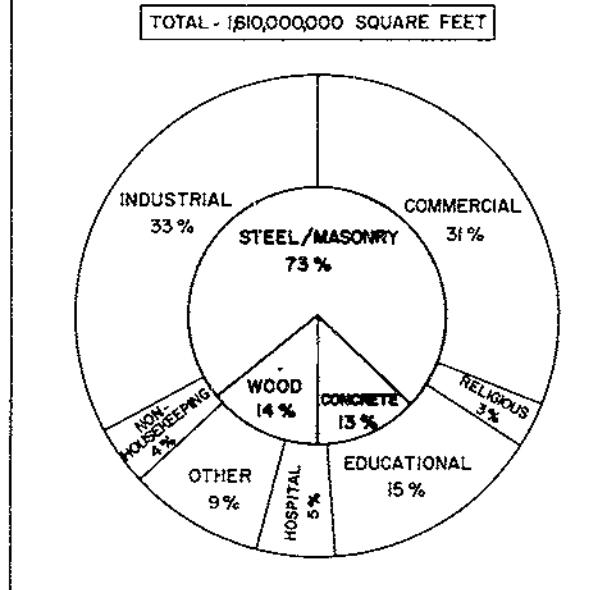

Figure 1

CONSTRUCTION VALUE

In 1969 the amount of building construction as measured by value of construction put in place was more than 32.7 billion dollars (table 2, fig. 2). Almost three-fourths of this value was in commercial, industrial, and educational buildings, one-fifth in hospitals and other, and the remainder in religious and nonhousekeeping buildings.

Some 69 percent of the value of construction was in buildings in the steel/masonry structural class, 19 percent in the concrete, and 12 percent in the wood. The relationships between building type and structural class based on value of construction were essentially the same as those based on floor area.

¹See definitions and procedure in the Appendix.

Construction value, by building type and structural class, 1969

TOTAL - 32,715,000,000 DOLLARS

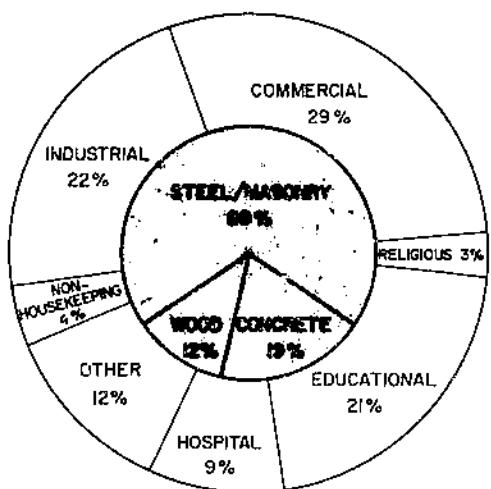

Figure 2

VALUE OF CONSTRUCTION PER SQUARE FOOT OF FLOOR AREA

Construction value for all building types, regions, and structural classes averaged \$20.32 per square foot of floor area (table 3).² Hospitals had the highest value (\$35.82) per square foot, and industrial buildings the lowest (\$13.78). Buildings classified in the concrete structural class had the highest value (\$29.87) per square foot of floor area, and buildings in the wood structural class the lowest (\$16.88).

²Construction value per square foot of floor area (table 3) was derived by dividing the values of new construction put in place (table 2) by floor areas of new construction put in place (table 1).

WOOD PRODUCTS USE IN BUILDING CONSTRUCTION

Wood products use per 100 square feet of floor area and per \$1000 of construction value were derived from a sample of building projects stratified by building type and structural class. Use factors for various wood products are shown in the following appendix tables:

- Table 4 - Lumber
- Table 14 - Glued-laminated lumber
- Table 24 - Plywood
- Table 34 - Hardboard
- Table 44 - Particleboard
- Table 54 - Insulation board
- Table 64 - Structural wood-fiberboard

An estimated 1,644 million board feet of lumber, 216 million board feet of glued-laminated lumber, 974 million square feet of plywood (3/8-inch basis), 42 million square feet (1/8-inch basis) of hardboard, 14 million square feet (3/4-inch basis) of particleboard, 80 million square feet (1/2-inch basis) of insulation board, and 185 million square feet (1-inch basis) of structural wood-fiberboard were used in nonresidential and non-housekeeping building construction in the United States during 1969.

Lumber used, by building type and structural class, 1969

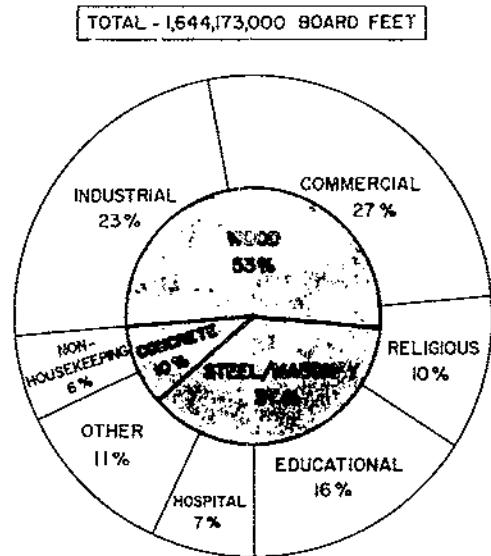

Figure 3

LUMBER

Total lumber

About half of the 1.6 billion board feet of lumber used, including glued-laminated lumber, went into industrial and commercial buildings (table 5, fig. 3). These buildings accounted for 64 percent of the floor area and 51 percent of the construction value. More than half of the lumber was used in the wood structural class which accounted for only 14 percent of the floor area and 12 percent of the construction value.

For all buildings, 44 percent of the lumber was used in roofs, principally as beams, rafters, joists, and decking (table 6, figure 4). Another 20 percent was used for facilitating purposes such as forming materials for concrete. The remaining 36 percent was about equally distributed in floors, walls, and millwork. Two-thirds of the lumber used in wood structures went into roofs while almost two-thirds of the lumber used in concrete buildings was for facilitating purposes.

Details of lumber use by building type, structural class, and construction item are shown in tables 7-13.

Lumber used in construction by building component, 1969

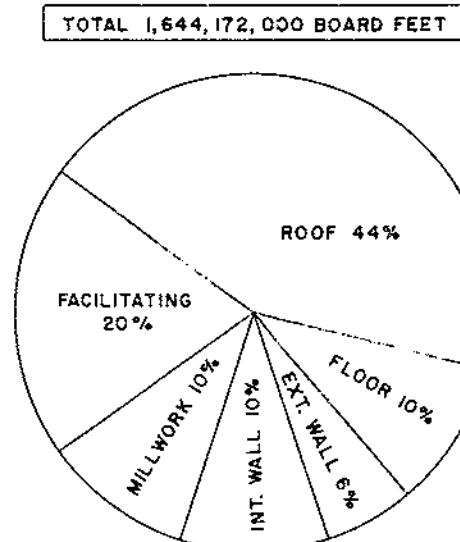

Figure 4

Glued-laminated lumber

About 12 percent of the total lumber used in nonresidential and nonhousekeeping buildings was in glued-laminated products such as beams, purlins, and decking. Forty percent of the 192 million board feet of glued-laminated lumber was used in industrial buildings located primarily in the West³ (table 15, fig. 5). Most of the remaining use was in commercial, religious, educational, and other buildings. Nonhousekeeping and hospital buildings accounted for only 2 percent.

Approximately 99 percent of the laminated lumber was used in buildings in the wood structural class, the other 1 percent in the steel/masonry and concrete classes.

Glue-laminated lumber used by building type and structural class, 1969

TOTAL 192,070,000 BOARD FEET

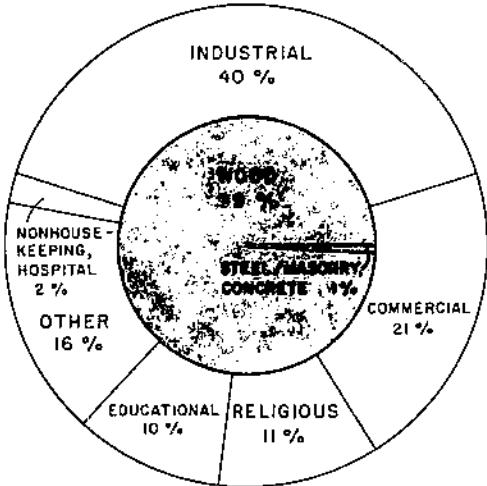

Figure 5

Ninety-five percent of the glued-laminated lumber was used in roofs principally as beams and purlins (table 16, fig. 6) Use in floor beams and decking accounted for most of the remainder.

Tables 17-23 show use of glued-laminated lumber by building type, structural class, and construction item.

³ Reid, William H., and Wright, Maurice G. 1974. Lumber and plywood used in the construction of nonresidential and nonhousekeeping buildings, by regions in the United States, 1969. USDA Forest Service, Res. Pap. WO-24, 24 p.

Glued-laminated lumber used in construction by building component, 1969

TOTAL 192,070,000 BOARD FEET

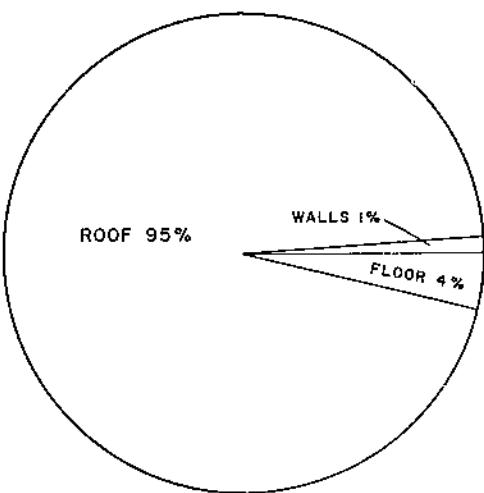

Figure 6

PLYWOOD

Almost 975 million square feet (3/8-inch basis) of plywood was used in construction of nonresidential and nonhousekeeping buildings in 1969 (table 25, fig. 7). Though most of the plywood went into commercial (28 percent), educational (20 percent), and industrial buildings (17 percent); nonhousekeeping, religious and hospital buildings had the highest use per unit of floor area and construction value. Thirty-eight percent of the plywood was used in buildings in the wood structural class, 41 percent in the steel/masonry, and 21 percent in concrete structures.

Facilitating uses, roofs, and millwork items took most of the plywood used in all buildings (table 26, fig. 8). In the wood structural class, 53 percent went into roofs, nearly all of it as decking. About half of the plywood in steel/masonry buildings was used for facilitating purposes and one-fourth went into millwork items such as shelving and cabinets. In concrete structures, 72 percent of the plywood was used for facilitating purposes and 21 percent was used in millwork.

Plywood use in the different building types, by structural class and construction item, is detailed in tables 27-33.

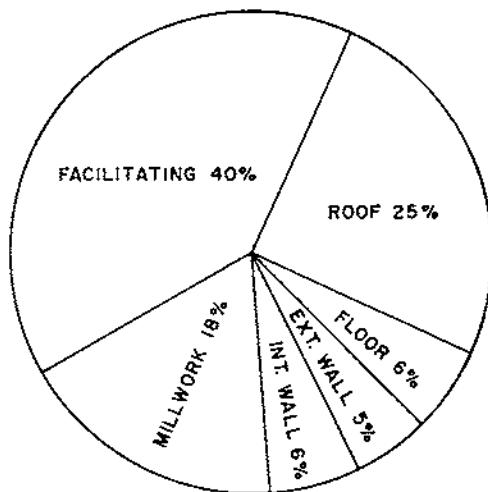

Figure 8

HARDBOARD

Of the 42 million square feet of hardboard used in all nonresidential and nonhousekeeping buildings, 39 percent was used in educational and 21 percent in commercial buildings (table 35, fig. 9). Nonhousekeeping buildings had the highest use per unit of floor area and construction value and, thus, accounted for 12 percent of hardboard used though they represent only 4 percent of the floor area of all buildings. Use of hardboard by structural class was 61 percent in steel/masonry, 22 percent in wood, and 17 percent in concrete structures.

Almost 62 percent of all hardboard used was in millwork, primarily cabinets (table 36, fig. 10). Over 28 percent was used in interior walls as paneling and partitions. The remaining 10 percent was used in the exterior walls, roof, and floor areas, and for facilitating purposes.

Hardboard use by building type, construction item, and structural class is shown in tables 37-43.

PARTICLEBOARD

Total particleboard use amounted to 14 million square feet (3/4-inch basis) (table 45, fig. 11), 58 percent in nonhousekeeping and educational buildings, 15 percent in hospital buildings, and the remaining 27 percent divided almost equally among the industrial, commercial, religious, and other buildings. Among structural classes 61 percent was used in steel/masonry, 24 percent in concrete, and 15 percent in wood structures.

Ninety percent of all particleboard was used for millwork, principally cabinets, shelving, and doors (table 46, fig. 12). Except for commercial and religious buildings, use of particleboard within building types was similar to that in all buildings (tables 47-53). Particleboard was used in the floor of commercial and in the roof of religious buildings in addition to being used as millwork.

Hardboard used, by building type and structural class, 1969

TOTAL 13,817,000 SQUARE FEET
(3/4-INCH BASIS)

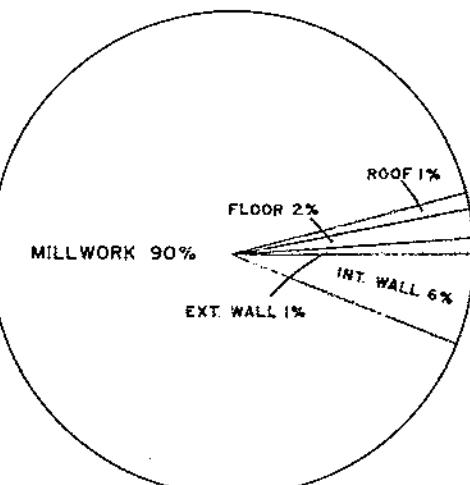

Figure 12

INSULATION BOARD

Total use of insulation board amounted to 80 million square feet (1/2-inch basis) (table 55, fig. 13). Slightly less than 51 percent was used in industrial buildings, 15 percent in commercial buildings, and 11 percent in educational buildings. Over 83 percent was used in the

steel/masonry structural class. The remaining 17 percent was almost equally divided between the wood and concrete structural classes.

Almost 93 percent was used as roof insulation (table 56, fig. 14). Another 4 percent was as underlayment in the floor areas of nonhousekeeping and commercial buildings (tables 57-63).

Insulation board used, by building type and structural class, 1969

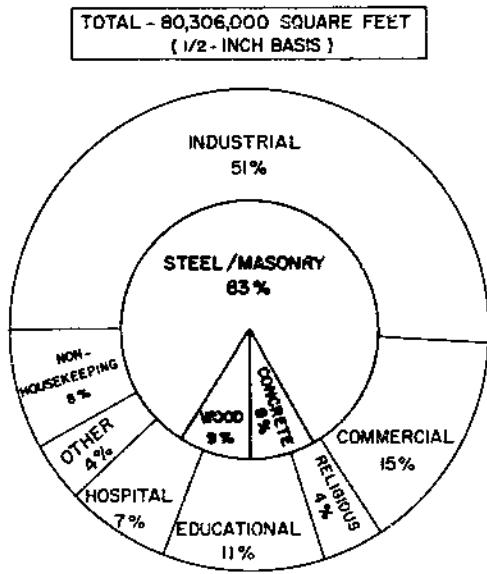

Figure 13

Insulation board used in construction by building component, 1969

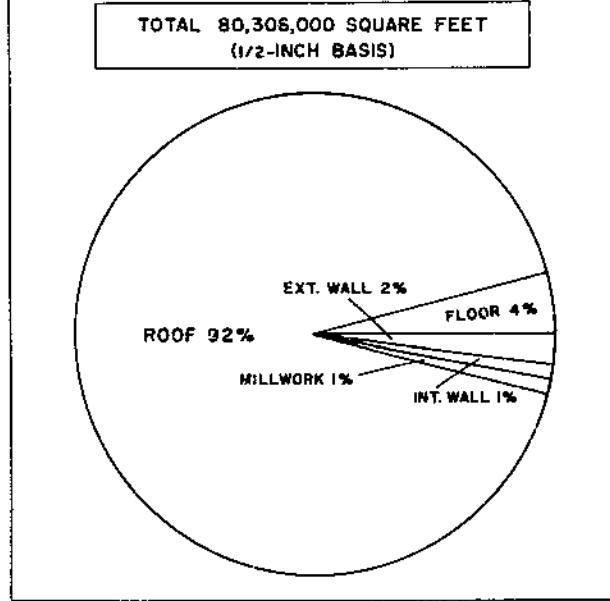

Figure 14

STRUCTURAL WOOD-FIBERBOARD

Structural wood fiberboard⁴ use amounted to 185 million square feet (1-inch basis) (table 65, fig. 15), 85 percent of it in industrial and educational buildings. Almost 90 percent was used in the steel/masonry structural class. Nearly all (99 percent) of the structural wood-fiberboard was used in the roof area principally as decking (table 66, fig. 16). Minor amounts were used in

commercial, educational, and hospital buildings as paneling (tables 67-73).

⁴Structural wood-fiberboard is manufactured from excelsior-like strands of wood fibers and inorganic hydraulic cement (portland cement or gypsum) bonded together under pressure and heat. Densities of the product may range from 22 to 36 pounds per cubic foot; thicknesses from 2 to 4 inches; and widths from 24 to 48 inches.

APPENDIX

DEFINITIONS

Building type¹

Nonhousekeeping	Buildings that provide residential facilities other than housing units and are generally characterized as nonhousekeeping quarters such as hotels (other than apartment hotels), motels, and dormitories.
Industrial	Buildings of manufacturing establishments, as defined in major groups 19-39 of the Standard Industrial Classification Manual, which are used to house production, assembly, and warehousing activities as well as auxiliary facilities such as administration buildings.
Commercial	Buildings that are primarily for the rental of office space, to house banks and other financial institutions, or for use in wholesale, retail, and service trades, such as stores, restaurants, and garages.
Educational	Buildings that are used directly in the administrative and instructional activities of establishments furnishing formal academic or technical courses. These establishments include colleges and universities, elementary and secondary schools, libraries, museums, and art galleries as well as laboratories which are not part of manufacturing establishments.
Religious	Buildings that are used primarily for religious services and functions or to house and train religious personnel; such as churches, synagogues, convents, monasteries, theological seminaries, etc., as well as funeral parlors, mausoleums, and crematories.
Hospital	Buildings for establishments which are primarily engaged in providing hospital and institutional care as general, mental, and tuberculosis hospitals, clinics or infirmaries, sanitariums, nursing homes, homes for the aged, orphanages, etc.
Other	Buildings, except farm and public utilities, which are not elsewhere classified such as auditoriums, theaters, indoor swimming pools, fire stations, bus and air passenger terminals, etc.

Structural class

Wood	Buildings that used wood in one or more of the following structural areas: a. Wall framing consisting of wood studs or timbers. b. Floor framing consisting of wood joists or beams. c. Roof framing consisting of wood rafters, trusses, beams, or decking.
Steel/masonry	Buildings whose structural framing consisted of steel columns, truss and girders, or buildings whose exterior walls consisted of concrete block, brick, or precast concrete and whose floor and roof support consisted of materials other than wood.
Concrete	Buildings whose structural framing consisted of reinforced concrete poured in place and whose floor or roof support consisted of materials other than wood.
<i>Other</i>	
Floor area	Measurements were taken to the outside of the exterior walls and include all enclosed, useable floor space.
Construction value	Includes cost of construction materials installed, labor, contractor's profit, architect's and engineer's fees, and building site preparation.
Value of construction put in place	A measure of the value of construction installed or erected at the site during given period. It includes new construction, additions, and alterations.

¹U.S. Department of Commerce Bureau of Census. 1971. Value of new construction put in place—1958 to 1970. Construction C30-70S, 101 p.

SURVEY PROCEDURE

This survey procedure may be divided in two categories—(1) measurement of construction activity, and (2) measurement of wood use.

Measurement of construction activity

In order to stratify construction activity in the United States, a sample of 6,400 building projects was selected from 54,000 projects for which contracts for construction were awarded during the period of March 1, 1969, through August 30, 1969. The sample projects were selected on the basis that the probability of selection was proportional to size, as measured by contract award value. F.W. Dodge Division provided Dodge Construction Reports for each of the 6,400 projects selected. Based on information contained in the reports, projects were classified into three structural classes—(1) wood, (2) steel/masonry, and (3) concrete. This information and other pertinent data concerning the project such as building type, floor area, and contract award value were entered on punch cards to facilitate data processing.

Measurement of wood use

Wood usage was determined by a material take-off from the plans and specifications of 842 building projects, and by contacting the building contractors for the project to determine the amount of wood required for the forming of concrete. Although this technique was time consuming, the use factors developed in this study, with updating for obvious changes in materials usage, may be employed for estimating current wood product requirements.

The sample of 842 building projects was selected from 5,400 projects reported in the Scan-Scope Weekly Bulletin during the period from July 1, 1968, to December 31, 1968. The projects were arrayed by building type and value, and the sample selected with the probability of selection proportional to value. Microfilms of architectural plans and specifications were obtained for each of the sample projects.

Measurements were taken from the plans relating to lumber and plywood use and converted to standard units of measure, i.e., board feet and square feet (3/8-inch basis). Regression equations were developed in the form $Y = A \cdot X^B$, where Y equals amount of wood use, X equals size of project in floor area or construction value, A equals a constant factor, and B equals a constant exponent. Regression equations relating construction

cost and floor area to lumber and plywood use were calculated for each building type and structural class. These equations were then applied to the 6,400 projects for which contracts for construction were awarded and which had been stratified by building type and structural class. Wood use per thousand dollars of construction and per 100 square feet of floor area were calculated for each stratum and applied to floor area and construction value resulting in total lumber and plywood use.

Wood use factors for glued-laminated lumber, hardboard, particleboard, insulation board, and structural wood-fiberboard were the sample mean value per 100 square feet of floor area and per \$1,000 of construction value.

The percentages of wood product use, shown by building type, structural classes, and construction items, were determined from the sample projects. These percentages were applied to the estimated total national use in each stratum to derive the amount of wood products use by building type, structural class, and construction item. The construction items are grouped under five building components as follows:

<i>Roof</i>	<i>Floor</i>
Trusses	Beams
Beams	Joists
Arches	Subflooring
Rafters/purlins	Decking
Joists	Underlayment
Decking	Finish flooring
Blocking	Stairs
Other	Other
<i>Exterior wall</i>	<i>Interior wall</i>
Studs	Studs
Furring	Furring
Siding	Partition
Sheathing	Paneling
Cornice/mansard	Other
Other	
<i>Millwork</i>	
Exterior doors	Base cabinets
Interior doors	Wall cabinets
Windows	Storage cabinets
Moulding/trim	Other
Shelving
