U.S. FATS AND OILS STATISTICS 1960-75

ECONOMIC RESEARCH SERVICE / UNITED STATES DEPARTMENT OF AGRICULTURE

ACKNOWLEDGMENTS

This bulletin was planned and prepared by the Oil Crops Program Area, Commodity Economics Division, Economic Research Service. Ralph Mullins directed the compilation and analysis of the statistical data and setting up the tables. Appreciation is also expressed to the other members of the Oil Crops Program Area for their contributions in the preparation of this bulletin. Larry Otto, Data Services Center, supervised the generation of tables from the ERS Data Information System.

PREFACE

This bulletin incorporates in one book a comprehensive series of conversion factors and domestic statistics on oilseeds, fats, oils and their products, and complements the salient statistics appearing regularly in the Fats and Oils Situation, issued five times a year by the Economic Research Service.

Statistics covering U.S. supply, disappearance, utilization, foreign trade, and prices of fats and oils have been compiled and published by the U.S. Department of Agriculture for many years. These series are based not only on information collected by the USDA's statistical agencies¹ but also on data published by other governmental agencies, such as the Bureau of the Census, the Bureau of Labor Statistics, and the Marine Fisheries Service. Some price series are obtained from published trade sources. These statistics are integrated, however, to provide types of information, such as supply and demand balance sheets, that are not available from the collecting agencies.

This handbook supersedes Statistical Bulletin No. 489, U.S. Fats and Oils Statistics, 1950-71, published in July 1972. Due to space limitations, it was necessary to omit statistics for earlier years. It is suggested that Statistical Bulletins No. 376 and 489 be retained to provide this earlier data.

A glossary of terms used by the fats and oils trade is included. The treatment is not all-inclusive, but provides the more common terms which may be helpful in interpreting data in this handbook.

Plans are to publish this bulletin annually.

¹Primarily the Economic Research Service, the Statistical Reporting Service, the Agricultural Marketing Service, and the Foreign Agricultural Service.

GUIDE TO TABLES

Page
Monthly Quarterly Annual

Supply, Disappearance, and Utilization
 Tables for selected commodities

Oilseeds:

Cottonseed:

Acreage, yield, production, and price.....	1
Supply and disappearance.....	1
Production, farm use, price, and value.....	2
Stocks at mills.....	2
Yield, price, and value of products per ton of seed crushed and price spread.....	3

Flaxseed:

Acreage, yield, production, and price.....	4
Supply and disappearance.....	4
Production, farm use, price, and value.....	5
Stocks in all positions.....	5
Yield, price, and value of products per bushel of flaxseed crushed and price spread.....	6
Crushings, yield of oil and meal, exports and receipts at mills.....	7

Peanuts:

Acreage, yield, production, and price.....	8
Supply and disappearance.....	8
Production, farm use, price, and value.....	9
Total stocks.....	9
Yield, price, and value of products per 100 pounds crushed	10
Allotments, acreage, yield, marketing quotas, and produc- tion.....	11
U.S. average support level and support rates.....	11
Edible use in primary products.....	12
Shelled; use in primary products.....	13

Soybeans:

Acreage, yield, production, and price.....	14
Supply and disappearance.....	14
Production, farm use, sales, and value.....	15
Stocks in all positions.....	15
Value of products per bushel of soybeans processed and price spread.....	16
Crushings, yield of oil and meal, exports and receipts at mills.....	17

Fats and oils and related products:

Production, imports, stocks, exports, disappearance, and utilization:		
Butter.....	19	18
Castor oil.....	21	20
Coconut oil.....	23	22
Corn oil.....	25	24
Cottonseed oil.....	28	26, 27
Fatty acids.....	30	29
Fish, sperm, and marine mammal oil.....	32	31

GUIDE TO TABLES--Continued

Page
Monthly Quarterly Annual

Fats and oils and related products--Continued:

Production, imports, stocks, exports, disappearance, and utilization:

Glycerine.....	34	33
Lard.....	36	35
Linseed oil.....	39	37, 38
Margarine, actual weight.....	41	40
Margarine, fat content.....	43	42
Palm oil.....	45	44
Palm kernel oil.....	47	46
Peanut oil.....	50	48, 49
Salad and cooking oils.....	52	51
Shortening.....	54	53
Soap.....	56	55
Soybean oil.....	58	57
Tall oil.....	60	59
Tallow, edible.....	62	61
Tallow, inedible, and greases.....	64	63
Tung oil.....	66	65

Meals:

Production, imports, stocks, exports, and disappearance:

Cottonseed.....	68	67
Fish.....	70	69
Linseed.....	72	71
Peanut.....	74	73
Soybean.....	76	75

Aggregate Series for Fats and Oils and High-Protein Meals

Total fats and oils:

Production, imports, stocks, exports, disappearance, and utilization.....

77

Use in products for civilian consumption.....

78

Food fats and oils:

Stocks, imports, production, exports, disappearance, and per capita disappearance.....

79

Total use for food.....

80

Civilian per capita consumption by type of product.....

81

High-protein meal:

Quantity available for feeding and high-protein feed-consuming animal units.....

82

GUIDE TO TABLES--Continued

Page
Monthly Quarterly Annual

U.S. Foreign Trade

Exports by country of destination and value:

Cottonseed.....	83
Cottonseed oil.....	84
Soybeans.....	85
Soybean meal.....	86
Soybean oil.....	87
Tallow, inedible, and greases.....	88
Imports by country of origin and value:	
Castor oil.....	89
Coconut oil.....	90
Palm oil.....	91
Palm kernel oil.....	92

Prices

Season average price received by farmers for soybeans, flax- seed, peanuts, and cottonseed.....	93
Selected commodities, received by farmers, wholesale, and retail:	
Butter.....	107 94 94
Castor oil.....	107 94 94
Coconut oil.....	107,108 94,95 94,95
Corn oil.....	108 95 95
Cottonseed.....	108 95 95
Cottonseed oil.....	108,109 95,96 95,96
Cottonseed meal.....	109 96 96
Flaxseed.....	109 96 96
Fishmeal.....	110 97 97
Fish oil.....	110 97 97
Glycerine.....	110 97 97
Grease.....	110,111 97,98 97,98

1/ BASIS OF SUPPORT PRICE DETERMINATION OVER 1951-55 PERIOD NOT COMPARABLE WITH THAT OF 1956-71. DURING THE 1951-55 PERIOD PRICE SUPPORT BY TYPES WAS ON THE BASIS OF A "BASE GRADE TON"; BUT AVERAGE QUALITY TON PRICES RATHER THAN BASE GRADE TON PRICES ARE SHOWN FOR THOSE YEARS. FOR YEARS SUBSEQUENT TO 1955, PRICE SUPPORT BY TYPES WAS BASED ON AN AVERAGE QUALITY TON.

2/ PRELIMINARY.

1/ Preliminary.

2/ Census export data to Canada overstated since Canada contains major transit ports and ultimate destination was unknown at time of shipment. Transshipment through Canadian ports are mainly destined for Western Europe and Asian countries. Census data to these countries are understated by the amount of transshipment via Canada.

3/ Less than 500 bushels.

N.A.—NOT AVAILABLE.

TUNG NUTS (FRUIT BASIS) 10/	SHORT TON	318	15.9	3/	3/	---	---

1/ BASED ON 1970-74 CROP YEAR AVERAGES FOR SOYBEANS, COTTONSEED, FLAXSEED, AND PEANUTS. 2/ CASTOR OIL IS REPORTED ALSO AS DEHYDRATED. TO CONVERT CRUDE TO DEHYDRATED, MULTIPLY BY 0.88; TO CONVERT DEHYDRATED TO CRUDE, MULTIPLY BY 1.136. 3/ NOT CUSTOMARILY REPORTED AS REFINED OIL. 4/ INCLUDES BOTH WET AND DRY PROCESSING. THE WET PROCESS ACCOUNTS FOR ABOUT 85% OF THE TOTAL CRUSH. 5/ TOTAL OUTTURN PER BUSHEL OF FLAXSEED PROCESSED MAY EXCEED 56 POUNDS SINCE SOME MILLS ADD FLAXSEED SCREENINGS TO THE MEAL. 6/ SEE SEPARATE TABLES ON FLAXSEED, PEANUTS, AND SOYBEANS FOR ADDITIONAL FACTORS. 7/ CUSTOMARILY, LINSEED OIL IS REFINED FROM RAW (DEGUMMED) OIL RATHER THAN CRUDE. THE LOSS IN REFINING IS ABOUT 2.5%. 8/ STRAIGHT RUN PEANUTS INCLUDED SHELLED NO. 1 AND 2 GRADE AND OIL STOCK. ESTIMATED OIL CONTENT OF PEANUTS EXPORTED AVERAGES ABOUT 43.5%. SOME ADDITIONS SHELLS ARE ADDED TO RESIDUE TO PRODUCE CAKE AND MEAL. 9/ INCLUDES ABOUT 36% MEAL AND 19% HULLS. 10/ 15% MOISTURE. N.A.--NOT AVAILABLE.

POUNDS OF PEANUT CAKE AND MEAL 7/	1,114

1/ BASED ON 1970-74 CROP AVERAGES.

2/ BEGINNING 1966 CROP YEAR, "FARMERS' STOCK" PEANUTS ARE REPORTED IN TERMS OF "NET WEIGHT" SO NO ADJUSTMENTS ARE NECESSARY.

3/ EXCLUDES ROASTING STOCK.

4/ EXCLUDES SHELLED OIL STOCK PEANUTS.

5/ INCLUDING ADDITIVES.

6/ YIELDS FROM FARMERS' STOCK ARE PROVIDED FOR STATISTICAL CONVENIENCE. IN ACTUAL PRACTICE, ONLY THE SHELLED PEANUTS ARE CRUSHED FOR OIL. SOME OF THE SHELLS ARE THEN ADDED TO THE RESIDUE TO PRODUCE THE CAKE AND MEAL.

7/ SOME ADDITIONAL SHELLS ARE ADDED TO THE RESIDUE TO PRODUCE CAKE AND MEAL.

GLOSSARY OF FATS AND OILS TERMS

Oilseed Processing and Rendering

Oilseed processing—The procedures involved in removing oil from oilseeds. There are 3 basic types of processes—solvent extraction, mechanical processing, and hydraulic pressing.

Solvent extraction—A process which usually uses hexane as a solvent to extract oil from oil-bearing materials. The residual oil left in extracted soybean flakes or meal can be reduced to 1 percent or less. In the United States nearly all soybeans are processed by solvent extraction. A substantial part of the cottonseed, flaxseed, and other oilseeds is handled by this method.

Mechanical processing—A continuous pressing process at elevated temperatures using expellers or screw presses. A rotating worm shaft within a pressing cylinder or cage is used to express the oil from the oil-bearing material. The oil content of the resulting press cake is about 4-6 percent.

Hydraulic pressing—An intermittent batch pressing operation using elevated temperatures in a hydraulic press which forces oil from oilseeds. The residual oil left in the oilseed cake is about 5-10 percent. This method is no longer used in the United States to any appreciable extent.

Fat splitting (hydrolysis of fat)—A process to obtain separately fatty acids and glycerin from vegetable oils or animal fats by use of heat, water, and a catalyst or enzyme. At temperatures of 100-150 degrees centigrade, fats (triglycerides) and water in the presence of lime, zinc, magnesia, or other catalysts are soluble and "splitting" the glycerin from the fatty acid occurs rapidly.

Wet milling—The manufacturing process which separates the corn germ, hull, gluten, and starch from the corn kernel with water as the suspension medium. Corn starch is the main product. The corn germ is the raw material processed to obtain corn oil.

Rendering—The process of separating animal fat from tissue and cellular structure by the application of heat, pressure, solvent, or combination of these.

¹ Terms and definitions widely used by the fats and oils trade in conjunction with production, processing, marketing, and utilization of oilseeds, fats and oils, protein meals, other products and competitive commodities. The treatment does not pretend to be all-inclusive. Not listed are many technical and chemical terms dealing with the numerous intermediate processed products that are widely marketed by the industry. For a comprehensive glossary of foreign trade terms, see "Dictionary of International Agricultural Trade, AH-411, Foreign Agricultural Service, April 1971."

Oil Mill and Renderers' Products

Crude vegetable oil—Extracted vegetable oils that have had no further processing or refining except possibly that of being degummed or filtered, settled, or both.

Degummed oil—The product resulting from washing crude vegetable oil with water and/or steam for a specified period of time and then centrifuging the oil-and-water mixture to remove the phosphatides, etc. The Bureau of the Census requires crushers degumming crude soybean oil to report the production of crude oil in terms of degummed weight.

Lecithin—The mixed phosphatides product obtained from vegetable oils in the degumming process. Soybean lecithin contains lecithin, cephalin, and inositol phosphatides, together with glycerides of soybean oil and traces of tocopherols, glucosides, and pigments. Soybean lecithin is added to many food products for its emulsifying and antioxidant properties.

Oilseed meals—The product obtained by grinding the cake, chips, or flakes which remain after removal of most of the oil from oilseeds. Oilseed meals are mainly a feedstuff for livestock and poultry. They are also used as a raw material for producing edible vegetable protein products.

Oilseed hulls—The outer covering of oilseeds.

Soybean millfeed—A byproduct resulting from the manufacture of soybean flour or grits, composed of soybean hulls and the tailings of the mill.

Linters, cotton—The short fuzz or fibers adhering to the seed that are removed by delinting machines as the first step in processing cottonseed for oil.

Tallow and grease—Fat rendered from livestock and poultry byproducts and animal wastes salvaged for rendering. Titre (hardness or softness of fat) distinguishes tallow from grease. An animal fat is tallow if its titre is 40 degrees C or higher and grease if its titre is below 40 degrees. Most tallow is rendered from beef fat. Cattle slaughter probably provides over three-fourths tallow production. Grease, obtained mainly from pork fat, depends largely on hog slaughter. Census Bureau reports on production, consumption, and stocks do not show separate statistics for tallow and grease.

Meat meal and meat and bone meal—Meat meal is the finely ground dry-rendered residue from animal tissue. If it contains more than 4.4 percent phosphorus it is called meat and bone meal. These products are used in animal feeds.

Tankage—The residual animal tissue that has been prepared by dry-rendering or by tanking the animal fat under live steam. Most tankage is used for animal feed; some is used as fertilizer.

Refining Processes

Refining—The purifying treatment for removal of free fatty acids, phosphatides, proteinaceous and mucilaginous substances or other impurities from the fat or oil. The most important method of refining is by treatment of the fat or oil with an alkali—usually caustic soda or soda ash. This results in almost complete removal of free fatty acids through their conversion into oil-insoluble soaps. Phosphatides, proteinaceous, and mucilaginous substances are soluble in the oil only in an anhydrous form and upon hydration with the caustic or other refining solution are readily separated.

Refining loss—The loss from the original quantity of crude oil resulting from various refining processes. This loss varies considerably depending on the free acid content of the oil, other substances removed during refining, and the method of refining.

Bleaching—The treatment given to remove color-producing substances and to further purify the fat or oil. It is normally accomplished after the oil has been refined. Edible oils are generally bleached with adsorbents such as fuller's earth or activated charcoal, while industrial oils are usually bleached with sulfuric acid or chemical agents.

Boiled, blown, bodied—Various refining processes applied to oils used by the paint and varnish industry to enhance the drying qualities of the oils. Boiled oils are made by adding a "drier" (such as oxide of lead, manganese, or cobalt), heating the oil to 125 degrees to 150 degrees centigrade, then cooling immediately. Air is continually blown through the oil during the heating. Blown oils are prepared in much the same manner as boiled oils except that the air-blowing continues for a longer period and the temperatures are kept below 125 degrees centigrade. Bodied oils (originally known as stand-oils) are made by heating the oil to around 300 degrees centigrade for about 6 hours in the absence of air.

Deodorizing—The process of producing bland edible oils by removing trace constituents that give rise to undesirable flavors and odors. Live steam is passed through the hot oil, usually under vacuum, to deodorize it. This is normally accomplished after refining and bleaching.

Winterizing—The process of chilling refined oil, holding it at proper temperatures to separate higher-melting glycerides by crystallization, and filtering them out. The

"wintered oil" remains clear and bright and is used as salad or cooking oil. Winterization is carried out after refining and bleaching but before deodorization.

Vegetable stearine—The filtered-out portion of winterized vegetable oils. These crystallized glyceride compounds usually contains appreciable quantities of stearic acid.

Hydrogenation—A process of passing hydrogen gas through liquid oils in the presence of a catalyst (nickel) for the purpose of saturating the fatty acids (hardening them) for use in the manufacture of shortening and margarine. Hydrogenation makes a white hardened product which has a longer shelf life without refrigeration.

Flaking—A process of "super-hydrogenation" which produces a much harder product than normal hydrogenation. Flaked vegetable oil (flaked shortening) is used primarily by the baking and confectionery industries because of its keeping and baking qualities and other desired qualities affecting the finished product.

Emulsifier—Agents which markedly lower the interfacial tension between oil and water or other liquid thus permitting them to mix to form emulsions. Lecithin and mono-and diglycerides are emulsifiers derived from fats and oils and widely used in foods products (margarine, shortening, salad dressing, frozen desserts, peanut butter, candy, etc.).

Sulfonation—A process where fatty oils are treated with sulfuric acid to obtain sulfonated oils. They are used for textile and leather processing. When castor oil is sulfonated it is known as "turkey red oil" and is used in dyeing and emulsification.

Iodine number (Iodine value)—The number of grams of iodine which will react with 100 grams of fat. It is a measure of the unsaturated fatty acids in a particular oil. Oils with relatively large quantities of unsaturated fatty acids are good drying oils. Higher iodine numbers indicate faster drying oils.

Antioxidants—Substances which inhibit the oxidation of fats and oils. They are added to fats and oils or fat-containing products to provide greater stability and longer shelf-life by delaying the onset of oxidative rancidity.

Refined, not further processed—Vegetable oils that have been refined by any one of or several processes, excluding oils that have been bleached, deodorized, hydrogenated, or winterized.

Refined and further processed—Includes oils that have been subjected to alkali or soda ash or other refining

processes, and also may have been bleached, deodorized, hydrogenated, and/or winterized.

Once refined—Oil that has been treated by alkali or caustic wash.

BPSY (bleachable prime summer yellow)—A term applied to once-refined cottonseed oil of bleachable quality that, after bleaching, will contain 0.25 percent free fatty acids or less, a very small quantity of color bodies, and water and volatile matter not to exceed 0.10 percent.

Technical grade refined oils—Includes a wide variety of oils that are specially refined and further processed to meet requirements or specifications for a definite industrial use.

Soapstock—The byproduct obtained when vegetable oils are deacidized by various refining methods. Soapstock contains undesirable impurities and fatty acids. In alkali refining of soybean oil, soapstock averages about 6 percent of the volume of the crude oil being refined. Soapstock is usually referred to as "foots" since it accumulates at the bottom (foot) of the refining tank.

Foots (sludge)—The semisolid residue which settles to the bottom of the tank or car in which crude oils are stored or shipped. Steam usually is applied to facilitate their removal. Sometimes referred to as "tank bottoms."

Acidulated soapstock—Soapstock, which usually contains fairly large quantities of fatty acids, is treated with sulfuric acid and boiled to separate the fatty acids from the other materials. Separation is complete enough to produce a product—acidulated soapstock—containing 85-95 percent of total fatty acids.

MIU—Is the combined content of nonfatty material in tallow and grease—moisture (M), insoluble impurities (I), and unsaponifiable matter (U). Maximum level is specified for different grades of tallow and grease.

Fatty acids—The product obtained when glycerine is split off from the triglycerides of fats and oils by any method of hydrolysis. Triglycerides are composed of 3 molecules of fatty acids and 1 molecule of glycerine. Since these acids are found only in natural fats and oils, the term fatty acids applies to any acid that can be obtained from natural fats and oils. After hydrolysis, 100 grams of fat yield approximately 95 grams of fatty acids. As a result of the predominance of fatty acids over glycerine, the type of fatty acid present in the various fats and oils determines to a large extent the characteristics of a given product. In the field of industrial usage, fatty acids are usually further classified according to the treatment to which they are subjected subsequent to hydrolysis.

Free fatty acids—Fatty acids which can easily be removed from fats and oils by deacidification. Deacidizing of edible oils is usually done by an alkali refining process while industrial oils are washed with acid or water or both. Removal of the free fatty acids is necessary because of the instability of such acids to heat and oxidation. In simpler terms, free fatty acid content reflects the condition of fats and oils—the degree of rancidity.

Fatty acids (classification of)—Fatty acids occurring in fats and oils can be classified as to their degree of saturation. Those containing only single-bond carbon linkages are termed *saturated* and are the least active chemically. Saturated acids (such as stearic, palmitic and lauric) in their normal forms are solid at room temperature.

Fatty acids containing one or more double-bond carbon linkages are termed *unsaturated*. These acids in their normal forms are liquid at room temperature. Fats and oils contain both saturated and unsaturated fatty acids but in differing proportions. Depending upon requirements, unsaturated fatty acids can be changed into saturated materials, but the reverse is not commercially feasible.

When the fatty acid contains one double bond (such as oleic acid) it is called *mono-unsaturated* and if it contains more than one double bond, it is called *polyunsaturated*. Linoleic acid has 2 double bonds and linolenic acid has 3 double bonds.

The degree of total unsaturation of a fat (the number of double bonds present) is normally expressed in terms of the iodine value of the fat.

Glycerine—Natural glycerine is a byproduct of the soapmaking and fatty acid industries. Synthetic glycerine is manufactured from petroleum raw materials. Glycerine's wide range of use from explosives to emulsifiers indicates its versatility in all areas of industry.

Definitions

Fats and oils—Substances of plant or animal origin which are predominantly the trifatty acid esters of glycerine, commonly called "triglycerides." This excludes essential oils and mineral (petroleum) oils. The term "fat" usually refers to materials which are solid or plastic at ordinary temperatures, while oils are liquid. No rigid distinction can be made between the two and it is common practice to use the terms interchangeably, except where a distinction between solid and liquid materials is important.

Fats and oils make up one of 3 major classes of food materials, along with carbohydrates and proteins.

Margarine—A fatty food product prepared by blending fats and oils with other ingredients, usually milk solids, salt, flavoring materials, and vitamins A and D. It is manufactured under Food and Drug Administration (FDA) Standards of Identity and must contain at least 80 percent fat. The fats used in margarines may be from either animal or vegetable origin, although vegetable oils are by far the most widely used.

Shortening—A semisolid, fatty food product made entirely from edible vegetable oils, a blend of vegetable oils and animal fats, or pure animal fats, for use in cooking, baking, and frying. There are 2 general classes: (a) compound or blended, classified on the basis of the raw material used as ingredients, and (b) hydrogenated, which may be further identified on the basis of their intended use. The distinction between blended and hydrogenated shortening is no longer clear-cut. Hydrogenated shortenings are usually made from blends of 2 or more hydrogenated fats; the refined and deodorized oils may be hydrogenated individually or in combination to the same or different degrees of saturation and then blended in the proportions necessary to give the desired characteristics in the finished product.

Baking or frying fats (shortening)—The Bureau of the Census defines baking or frying fats as products which meet all of the following conditions: (1) manufactured from vegetable oils, meat fats, or a combination, (2) which have been deodorized or hydrogenated and deodorized, (3) containing a significant amount of glycerides solid at room temperature, (4) and produced and sold entirely or primarily for baking or frying purposes.

Salad and cooking oils—Products prepared from vegetable oils that are usually refined, bleached, deodorized, and sometimes lightly hydrogenated. Census Bureau definition includes products which have been manufactured from vegetable oils and deodorized or winterized and deodorized, and which are completely liquid at room temperature.

Mellorine—A frozen dessert made from edible vegetable oil or animal fat, sugar or other sweetening agents, milk solids, and flavoring. The fat content of mellorine averages about 8 percent.

Mayonnaise and Salad Dressing—Emulsified, semisolid, fatty foods that by Food and Drug Administration (FDA) regulation, mayonnaise must contain not less than 65 percent (by weight) edible vegetable oil and salad dressing 30 percent. Salt, sugar, spices, seasoning, vinegar, egg yolk, lemon juice, and other seasoning or flavoring ingredients complete these products.

Salad dressings, pourable type—Pourable salad dressing may be in the form of a separable liquid food or an emulsified viscous food. There is a great variety of products available, which vary in composition, including in oil content. Italian, French, and Roquefort types are representative of this class. FDA standard for French dressings requires an edible vegetable oil content of not less than 35 percent (by weight). Some other ingredients that may be used in the preparation of the pourable dressings are salt, sugar, emulsifiers, spices, seasonings, and acidifying agents.

Mono- and Diglycerides—Prepared by reacting either fatty acids or fats and oils with an excess of glycerol in presence of a catalyst. This product contains 60 percent or less monoglycerides, the remaining being mostly diglycerides with a small amount of triglycerides. Large amounts of mono- and diglycerides are purposely formed within shortening. These shortenings are termed "high ratio" or "superglycerinated" shortening. Mono- and diglycerides are widely used as food emulsifiers.

Soap—A commercial cleansing and sudsing agent made of water-soluble salts of fatty and other natural acids.

Synthetics—Products derived principally from nonagricultural sources or from agricultural sources processed so their origin is not easily identified.

Synthetic detergents—Manmade compounds (other than soap) which are surface active in water and can be used effectively for cleaning. They are usually produced from material of the petrochemical industry.

Tall oil—A byproduct of the sulphite digestion of pulpwood for kraft paper manufacture. Tall oil is not a true fat or oil but consists of a natural mixture of 45 percent each of resin acids and fatty acids and 10 percent unsaponifiable matter. The fatty acids are primarily linoleic, oleic and linolenic acid.

Urea—A synthetic nitrogen compound produced from carbon dioxide and ammonia, or from calcium cyanamide under heat pressure. It is the principal source of inorganic nitrogen used in mixed feeds. It is converted to protein by action of bacteria in the rumen of beef and dairy cattle, sheep, and goats. The main use of urea, however, is still as a fertilizer.

Drying oils—Oils that have the ability to polymerize or "dry" after they have been applied to a surface to form tough, adherent, impervious, and abrasive resistant film. Their film forming properties are closely related to their degree of unsaturation.

Surface coatings—Paints, varnishes, lacquers and enamels that are used as protective and decorative coatings. Bureau of the Census breaks down production between trade-sales finishes and industrial finishes.

Soybean Protein

Protein—A naturally occurring combination of amino acids, containing the chemical elements carbon, hydrogen, oxygen, nitrogen, and sometimes sulphur; one of the essential constituents of all living things and of the diet of animals and man.

Amino acids—Chief components and determinants of the characteristics of a protein; the building blocks of living tissues. Eighteen different amino acids commonly occur in our food supply and eight are considered essential because the body cannot make them from other materials.

Soybean meal—The product obtained by grinding the cake, chips, or flakes which remain after removal of most of the oil from soybeans by a mechanical or solvent extraction process. This product contains 41-50 percent protein, 3-7 percent crude fiber, and usually about 1% or less fat. Soybean meal is used as feed for livestock and poultry. Soy grits and flour are commonly used for human consumption.

Soy grits and/or flour—The ground, screened, graded product obtained after extracting most of the oil from selected, sound, clean, dehulled soybeans. They are produced from grinding the defatted soy flakes. Grits are coarser ground than soy flour. Protein range is 40-60 percent.

Defatted soy flour—Flour produced by grinding soy flakes after the nearly complete removal of the oil from soybeans by solvent extraction; defatted soy flour usually contains about 1 percent fat. They are finer ground than soy grits.

Low-fat soy flour—Flour produced either by partial removal of the oil from soybeans before grinding or by adding back 5-6 percent soybean oil or lecithin to defatted soy flour.

High-fat soy flour—Flour produced by adding back about 15 percent soybean oil or lecithin to defatted soy flour.

Full-fat soy flour—Flour containing all of the oil originally present in the raw soybeans; usually 18-20 percent.

Soy protein concentrate—Produced from defatted soybean flakes or flour by a process which immobilizes the protein and removes soluble sugars, minerals, etc. Concentrate has a protein content of 70 percent.

Isolated soy protein—Protein which has been greatly concentrated from its native location by chemical or mechanical means. It is produced by extracting white flakes or flour with water or a mild alkali. Isolate generally has a protein content of 90 percent.

Textured vegetable protein—Soy or other vegetable protein that has texture imparted either by spinning a fiber and combining the fiber in layers to achieve the desired texture, or by a thermoplastic extrusion process.

Meat analogs—Material usually prepared from vegetable protein to resemble specific meats in texture, color, and flavor.

Meat extenders—Use of soy or other vegetable proteins as partial substitutes for meat in processed items such as patties, chili, casseroles, etc.
